THE BUILDING DISPUTE

The employers' and operatives' representatives had meetings at their respective offices in Glasgow recently, but the questions under discussion were mainly of a private character. The operatives heard reports from the various districts, and they considered that satisfactory progress was being made.

An official of the Glasgow Operatives' Disputes Committee stated that the attention of the committee had been drawn to the fact that unskilled men were being employed on contracts from which building trade labourers had withdrawn their labour on account of the strike. The Committee had decided, he said, that all such jobs would be regarded, even after the strike, as "blackleg," and that no craftsmen would be allowed to work there.

The Scottish employers in a statement to the Press mention that the manifesto issued by the operatives' secretary in Scotland still maintains a claim that 60 per cent. of their operatives who are members of the union are working. It must, they state, be noted that such a claim, having in view the almost complete stoppage of building trade work in Scotland south of Dundee, simply exposes the known fact that the operatives' union does not contain in its membership more than 40 per cent. of the workmen. The further claim that 600 employers have signed the agreement has already been disposed of from the national headquarters in London, whereupon Mr. Coppock claimed that 350 employers had agreed to the men's demands. This will obviously cover all the employers not only in the south of Dundee but north of Dundee, where the operatives' union are content to observe the old conditions. The building trade employers are satisfied, they state that instead of an increase in the number of men employed, the lock-out notice and the withdrawal of signed agreements has replaced hundreds of men on the strike roll.

OBITUARY

The death took place recently of Mr. John Henderson, Director of Glasgow School of Art. His father was the late Mr. Joseph Henderson, the Scottish marine and landscape painter, whose three sons also became artists. Mr. John Henderson, the second son, was born in Glasgow in 1860, and was educated at a private school and at Glasgow University. He graduated Master of Arts in 1881, with first-class honours in philosophy. On the death of his older brother, he decided to follow the profession of the fine arts, and he studied painting under his father and also at the Glasgow School of Art, of which he afterwards became the head. Early in his career, Mr. Henderson took an active interest in matters connected with the teaching of art in Glasgow. Some twenty years ago he became a member of the Board of Governors of the School of Art, representing on that body the Haldane Trust. He became vice-chairman of the board ten years ago, and when Mr. F. H. Newbery retired from the directorship of the school, about seven years ago, he was succeeded in that position by Mr. Henderson. He was also chairman of the Haldane Trust and a governor of the joint board of the Glasgow School of Architecture.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

-No. 4254. AUGUST 15, 1924.

EDUCATIONAL VALUES

nan builds to himself alone. Let the proprietor do as he likes inside his building, for we need not call upon him. Bad ed not be seen, books need not be read, but nothing but blindness or the numbing of our faculty of observation can protect buildings in the street.—PROFESSOR LETHABY.

E have read somewhere that the simple enjoyment of beautiful things seems to be the privilege of youth. We would dismiss this philosophy as foolish if it meant that delight should fade with the coming of ge; it would mean that our knowledge had been bought. If, however, we accept the essential truth philosophy we are bound to find fault with a system tion which fails to supply the beautiful things for the ment of the youthful mind.

find ourselves thinking of architecture as one of the l things, and we have in mind the future towns and hen we are discussing the teaching of architecture ols. It is true that though most of our elementary uildings are hygienic, many of them are distinctly t is a curious trait in some of our educational reformers, hey do not fail to grasp the significance of architectural in its influence upon the mind, they violently destroy tradition by substituting their own immature works. anging one educational theory for another, they find sary to design their buildings themselves. This is assing phase perhaps, and it is only fair to say that f our public schools realise their architectural respon-. Too much importance is attached to environment e who maintain that the attitude of students towards architecture of our universities is one of indifference. take is to assume that every student should (or could) oducer—an architect. We are reminded of Whistler's t upon Ruskin's lifelong study of pictures. "A life mongst pictures makes not a painter, else the policeman National Gallery might assert himself."

would like to believe that good taste, the appreciation nd lovely things, in themselves, in literature, in archi- in society, can be planted as a seed in the heart of a Education theories are plentiful in this age, but ately there are many doubts amongst educational ies about relative values in education. We are told ucation is not primarily the acquisition of knowledge red, by the way, an easy thing to acquire), but rather more difficult task of approaching gradually a right sitive appreciation of the fundamental problems of life There is a difficulty to be faced in all theories of educa- d it is most important in architecture); we have to our minds whether we are educating for appreciation uction.

ssume that the public is responsible for the low level ecture, and that the general lack of taste is the result ance in architectural matters. It is not our point to hese assumptions at the moment; the grounds are to indicate that a certain amount of architectural n at school could produce nothing but good. The have to determine is what we mean to aim at in our n. What architects mean (we presume) when they n educated public, is that their clients, being conscious eauties of architecture and their responsibilities to the ity, will commission an architect to design their . When this simple statement is analysed we begin at it is the beginning of any improvement in our archi- amenities. We cannot look to the average man for up and a sound knowledge of architecture, and it is that a certain amount of guide-book knowledge of ural dates and periods can do little more than give an uch of interest to the annual holiday. It may even add to the exclusiveness of architecture, as an art, to house designed by a speculative builder, and to deny nsibility for the appearance of the building. It is in that we have succeeded in covering the country with monotonous and vulgar houses, and in bringing up our on this tradition.

We take it for granted that school buildings should play their part as examples of architectural beauty, and we can appreciate the fact that it is difficult to find a place for architecture in the curriculum of public schools. It is generally argued that there is not time to teach very much about architecture at school, and that the most that can be done is to lay a good foundation for a subsequent knowledge of the subject. Experiments are being tried here and there, we believe, with success, proving that architects can do much useful work in our schools by explaining in simple language the elements of architecture. It is vastly more important that children should understand in a general way the real meaning of architecture than that they should inherit from their parents the trifling knowledge which distinguishes between a Norman and a Gothic arch. The observation of the children can be stimulated and their interest maintained by brief lectures upon the climatic, geographical and social conditions, of which it may be said that architecture is the result or effect. The architecture of the future seems to us likely to be almost wholly influenced by social developments, and if so, much must depend upon the outlook of the nation.

There is a negative side to architecture which cannot be overlooked. It embraces by far the greater portion of the buildings which comprise the dull towns and suburbs which surround the children, and form the background for the rest of their lives. Ugliness should be analysed and exposed, so that future generations will learn to think of architecture as an art for which they are directly responsible. It is fashionable to put forward the philosophy that we make an end of ugliness if we teach a love for beauty, but there is a simpler philosophy which attacks ugliness in every shape or form because it is morally wrong to produce it. We may not always get the beauty we are seeking, even if we can prevent ugliness, but it is a move in the right direction.

There is a form of architectural education which results in the knowledge of the pedant, whereas if a sense of responsibility were inculcated at school we might reasonably hope that the attitude towards architecture and civic decencies would be elevated to the status it deserves. Our public schools are the main sources which maintain the tradition of our social codes and conventions, yet it must be admitted that the arguments against certain improprieties would appear trivial compared with the greater offence of creating vulgarity in architecture. There is an absence of true culture in a nation which is unconscious of guilt when it commits an architectural solecism. Children are quick to see the difference between bad taste which is personal, and bad taste which is a permanent offence against society. It cannot be repeated too often that it is not sufficient that our architects should be educated; there must be a desire on the part of the people for better architecture. Some months ago Lord Curzon, in the course of an address, asked this question: "Could anyone explain why it was that whereas cottages built four hundred years ago costing next to nothing were among the most beautiful things in creation, they were being replaced by modern buildings which were an abomination of desolation?"

Much credit is due to Professor Lethaby for the efforts he has made to stimulate the interest of children in the arts of everyday life. At one moment he is writing upon the homely and beautiful arts and crafts of an earlier generation, at another he is writing upon the dreadful things we have contrived to make of our villages and towns. In teaching the children to recapture the pleasures of beautiful things, he also teaches them what he terms the minor items connected with town administration: decency, cleanliness, order, and fitness. The subject is one which should interest the Royal Institute of British Architects. We would like to see architects giving their services in their spare time, and we would like to see our schools equipped with a few illustrations of our finest buildings.

NOTES

Housing Costs.

A STRONG light is thrown upon the subject of housing by a letter in *The Times* by Mr. J. E. Drower. Whilst we do not quite agree with all he says, we must see that he has hit on some vital points. The speculative builder might not have succeeded so well as the writer suggests in face of increased cost of materials and labour, but his criticism of the long array of extra costs we are forced into by political action is shown below. He says: "The provision of houses for the working classes is now almost entirely in the hands of the local authorities, whose procedure differs completely from that of the speculating builder. Architects are now employed to design the houses, careful specifications are written, and surveyors prepare bills of quantities. The builder is allowed no discretion in his choice of material or method of building; he must provide the material and employ the methods specified and none other; he must do the whole building by day-work, and must not even sublet except by permission. Clerks of works are appointed to see that he carries out the strict letter of his contract, and his office expenses are increased by the Ministry of Health's requirements as to accounts and audits. The result of it all is that houses are now so expensive that the Government has to step in with a subsidy, and the rates are burdened to allow of the houses being let at rentals which the tenants can afford."

Problems of Architecture.

IT would be unfair not to recognise an improvement in the new cottages being built, and also in the planning of some of the larger housing schemes, in which economy is often found not a hindrance but an inspiration towards style, since it compels a new approach and a concentration on the essentials away from foolish ornamentation and the appeal of display. We are in a more difficult situation, however, when the more pretentious demands of commerce direct so much the forms of our larger city buildings. It is perhaps too easily assumed that the requirements of commerce will always secure for us good architecture, and there are some who will point to the new Regent-street as an example of the improvements created by the present more ambitious aims of commerce. If there were nothing in commercial aims which contradicted the aims of architecture, and the architect were free to do his work without hindrance to the claims of his vocation, this, no doubt, would be the case. We are perhaps too ready to accept the spirit of an age in which the claims of architecture do not always prevail, and it would be better to admit the problem of the present situation, which is to secure the right place of architecture in the direction of new buildings. There must be a communal sense in building, a sense of the obligation to what already exists, consideration of the relation of new buildings to older ones, also the claims of the street or place on which they are erected. It cannot be only what our private interest makes us think desirable. To build out of scale and character with the surroundings should appear to us as an offence, and the city claims from us consideration as well as the success of our business.

A Book of Designs.

PROBABLY the best-connected tribute to the work of the Architectural Association School is the Book of Design just issued by Ernest Benn, Ltd. (price one guinea). It is mainly a book of designs, but is prefaced by interesting articles by Messrs. Howard Robertson, Robert Atkinson, Oscar Faber, Walter M. Keesey, V. O. Rees, and L. H. Bucknell. All these contributions have a value of their own and should help to clear the view of students and others as to the aim we all have for the further the art of architecture. The desi on the whole, of definitely quality and will be quite as wel many in that most of them do no closely any special tradition. It haps well that there is little trace picturesqueness or of the lighter g architectural treatment. We n that the student is happier in his tion of a bungalow than of a chur council chamber rather than of a or an office building, but, take whole, we may certainly feel t designs indicate some progress the finer qualities of architectural The book is hardly one from whic any serviceable "crib," but we grateful for this volume of s designs.

Difficulties in Design.

IT is probably e write as follows to-d it would have been ten years ago. "O both in practice and in the writt of our moderns, architecture b construction is discarded as a basis. It is well for the studer reminded of the difficulties in the right constructional expression. materials are of such great stren adaptability that we can almos that any form will hold up s cannot see too clearly the depen form on construction. Our buildi not often have a purpose worth particular expression, but we remember that the architect m been called in so as to give th possible expression of a swaggerin tisement. If he can turn this in of forcible dignity he may have expression he can condone and e

A Coat of Paint.

THE rather charmi open iron railing borders the pave the street on the n of Westminster Abbey, with its Portland stone posts, a very

---

r- VERY encouraging indeed m is it to see such results from whole-hearted and well- directed voluntary effort for rovement as that which has he progress of the Birmingham iety. The report just issued ne, 1923, to June, 1924. Promi- gst the subjects dealt with are and we have already (March 21) the admirable work in connec- Aston Park, the alterations to still in progress and bid fair to very unique and valuable city Besides this, during the past lerable progress has been made mes for the improvement of ill, Muntz, Selly Oak, King's d Handsworth Parks. Designs have also been prepared for parks at Aston Yardley, Ladywood, Aston Reservoir, The Henburys, Pipe Hayes, Moseley New Pool, Trittiford Mill, Upper Witton Reservoir, King's Heath, and Sparkhill. The preparation of these designs and the careful inspection of their carrying out certainly constitute a valuable contribution to the objects for which the Civic Society was formed. Telephone kiosks, publications, lectures, public appointments, and last, but not least, very sustained effort towards the continual establishment of the Repertory Theatre, complete a list of activities which should earn the gratitude of Birmingham's citizens.

A valuable asset to the Society is, of course, the sympathy and help which has come to it from official quarters, and at present the Lord Mayor of Birmingham is the President of the Society. We congratulate the hon. secretary, Mr. Wm. Haywood, on the results he has been able to show in this report. The very success of the Society raises in one's thoughts the wonder whether our towns and cities can possibly thrive and get all the benefits they ought without a liberal and enlightened citizenship which can willingly undertake so heavy a burden as the pages of this report suggest.

War Office Devastation.

THE objections which have been raised to the acquirement for military purposes of Lulworth Cove, and the absorption of some of the most beautiful rural districts throughout the country from Northumberland to Cornwall as military centres, raises issues of national importance. These sites may be required as a means of so-called security, but in regarding the value of such security we should bear in mind what security we propose to reach, whether we ought not to consider the matter on wider grounds. It is strange that at a time when the desire for peace is so paramount, and the ruin, waste and failure of war as a reasonable solution is so strongly held, that it should even now be accompanied by war preparations more destructive to the beauty of England than ever before. If the desire for security operates in such a destructive manner, it is only less destructive than war itself, and further evidence of its failure. If the wholesale detacement of the country should prove an influence antagonistic to war it may be thought worth while to suffer the growing loss to rural surroundings, but if only the re-assertion of that hoary fallacy, *si vis pacem pare bellum*, the attitude of the War Office can only be regarded as a reaction towards the disastrous outlook which plunged the world into war ten years ago.

Houses at Burford.

GENERAL NEWS

Professional Announcements.

Mr. W. T. Davenport, F.S.I., quantity surveyor, Queen's Chambers, Warrington, has opened an office at 32, Victoria-street, Westminster, S.W.1.

Mr. D. H. Roberts, M.S.A., Wombwell, has been appointed lecturer in building construction and building science at the King's-road Technical Centre, Wombwell.

Change of Address.

Messrs. J. Walter Hanson & Son, architects, are removing from 78, King-street, South Shields, to 18, Eldon-square, Newcastle-on-Tyne.

Sheffield Public Hall.

The City Council of Sheffield propose to erect a public hall at an estimated cost of £350,000. It is expected building will commence next spring.

Wallace Collection.

The Lords Commissioners of His Majesty's Treasury have appointed Mr. Emery Walker, F.S.A., to be a trustee of the Wallace Collection in the place of Sir Martin Conway, M.P., who has resigned.

£400,000 Kent Road Scheme.

The Kent County Council recently approved in principle a £400,000 scheme for improving the Folkestone road between Maidstone and Folkestone, with by-passes at Lenham, Charing, and Ashford. The Ministry of Transport will contribute 75 per cent. of the total cost of the scheme.

Glastonbury Abbey.

The Dean of Wells, on behalf of the Trustees, has invited Mr. F. Bligh Bond, F.R.I.B.A., to take charge of the collection of architectural fragments that have from time to time been discovered by him during a period of excavation in Glastonbury Abbey grounds.

Ancient Monuments.

The Office of Works has notified the Cardigan County Council that Cardigan and Newcastle Emlyn Bridges have been scheduled as ancient monuments.

New Town Hall, Barnsley.

The Barnsley Town Council has appointed a sub-committee to deal with the question of building a new town hall. The Carnegie United Kingdom Trust has offered a sum of £9,000, on certain conditions, for the provision of a library in Barnsley, and the Town Council has informed the trustees that it will prepare a scheme in the near future.

Builders' Estates.

Mr. George Edward Powell, of Hunter House-road, Sheffield, builder and contractor, of Messrs. B. Powell & Son, Ltd., who died on April 30, aged 71, left estate of the gross value of £13,157, of which £12,496 is net personalty.

Mr. F. J. Trotter, of Leicester, builder (net personalty, £8,899), £11,058.

Obituary.

The death took place recently, at his residence, South Kensington, of Sir Claude Phillips, the well-known art critic, and Keeper of the Wallace Collection from 1897 to 1911.

The death occurred recently, at 72, Chapel-street, Hoyland Common, Sheffield, of Mr. Samuel Hawke, retired builder and contractor, aged 85 years.

The death recently took place at Montrose, in his 78th year, of Mr. James Black, builder.

The death of Mr. James John Angliss, a retired builder, at Kentish Town, N.W.5, took place recently.

The death took place recently at Middlesbrough of Mr. Arthur Marshall, aged sixty-three. Mr. Marshall was one of the best-known builders and contractors on Tees-side.

Correspondence.

A letter on a "Joint Council for the Building Trade," by Mr. J. E. Drower, is given on p. 258.

COMPETITION NE

Selby War Memorial.

The committee, out of five sets of plans mitted by architects for the proposed new Memorial Hospital, has accepted the submitted by Mr. Leslie T. Moore, F.R.I London.

Manchester Art Gallery.

The Corporation invite designs for a Gallery and Museum of Art. Applica accompanied by 5s., not returnable, t Town Clerk, Manchester. (See advertis this week.)

Club Premises.

The committee of the Rhyl Conservativ invite schemes for adding a second story Club premises. Particulars from the Secr Market-street, Rhyl.

London Hotel.

Designs for a row of shops, with an hotel Premiums of £150 are offered for the se designs. Particulars from Mr. H. Wa Imperial Hotel, Russell-square, W.C. 1.

The conditions of this competition are accordance with the regulations of the R.

National Eisteddfod.

At the National Eisteddfod the adjud did not consider any design worthy of prize in the architectural competition design for an art gallery and museum.

Other Competitions.

Other competitions still open includ following (the dates given are, first the se in date, and second the issue of *The Bui* which full particulars were given):—Ross Memorial (Sept. 30; Feb. 21). Harroga firmary (Sept. 30; May 30). Hamilto Memorial (Sept. 1; May 30). Glasgow School Memorial (Sept. 30; June 13). M Memorial (Aug. 22; June 13). Bexhill tainment Hall—Banned by R.I.B.A. (Se May 30) Public Baths, Newton-in-Mak (Sept. 30; July 11.)

DALLIONS FOR DOMESTIC GLAZING

By REGINALD HALLWARD.

but lately been occupied, in the in- my larger work, on medallions for decoration, of which a few examples this article, recently done for country nd the demand for such being on se as a means of adding charm to the particulars of the method and uch medallion work, as I have found y be of general interest. Like so gs, it is but a return to the custom ier time, which was encouraged by permanent character of the home. er the sale of an old house in ne years ago, the windows of which orated with ships painted on the e owner having been a sea-captain, tures of ships, probably those ther sailed himself or had interest other ways, he had had executed ch artist, and most delightful they the old man could treasure not alone y the associations connected with life, and sail his ships o'er again ked his cutty in the parlour.

d throughout the country from the of the sixteenth century medallion be seen, heraldic or other, set into g of windows in churches and uildings. The method and charac- production differ from earlier work, t that the colour is not always in but introduced on to it with enamel The scope of this enamel is quite d wholly unsuited for large sur- in its own particular field much work has been done. I have found ve only my own experience to guide namel colours tend to lose in trans- hen other than the primary colours uced, and that this clouding which en in the old work is due to these not having been observed. The and tertiary colours, the mixtures than the primary colours, I have tisfactory, and have therefore ruled limiting myself to the use of red, d blue colours which, superimposed ther, yield all the rest. I prefer er) stain to enamel yellow; and with n to these of a good enamel black s and light and shade, there is ll that is necessary, and such con- palette.

mel can be worked much as a s his colours, firing and refiring as ay be required to bring the colour strength and quality required. In y stained glass window it is dan- become over pictorial. The artist een trained as a painter and exe- knows this, and is careful lest he beautiful decorative colour and ty belonging to the material. But writing of this larger field of the ss window here, but of other ap- plications of glass methods; of a field, though small, in which the more pictorial can be delighted in, and presented in a charming way. In the case of the medallions illustrated, the subjects are painted on one piece of glass—a glass picture—the particular glass chosen for its adaptability to enamel and stain. The low toned Dutch window glass is very suitable, but being rather thin its fragility offers objection to its use, otherwise it is a delightful glass. The first firing in enamel work—the key block as it were—is painted in black enamel colour, a black-and-white, or mezzo-tinted drawing, which is then fired, subsequent firings being given as the colour is added, so many as are required. As the danger of breakage is generally in the first firing, the subsequent firings are at no great risk to the glass, and it can be put in again and again to deepen a tone or add to the colour. In leading up the glass afterwards to the ornamental surround, it is important to lead it loosely rather than tight, otherwise the sun's rays, expanding the glass when placed in the windows, may cause it to fly.

But enamel can also add a quality to ordinary stained glass. In my own work I find its aid very effective and useful. The use of enamels for details of ornament, the pattern on a dress, the enriching of the colour of inscriptions, in all these ways it provides another dimension for glass, and develops its resources further. The results have their own attractive characteristics, quite different from those obtained by aciding out the glass, and are an addition to it. Some glasses will not take the enamel well any more than they will take stain, but for those which will do so, for the border to a dress or cloak, to enrich lettering and so on, it is a helpful addition. Critics have sometimes puzzled themselves over my glass, wondering how these particular rather elusive and intimate effects are obtained. It is really a simple matter, but one not likely to be made use of unless one is very close to the work, seeing it through all its stages oneself. It is one of the advantages of this more intimate direction that we can give attention to the little more—and how much it is—to the difference, often one of hair-breadths, yet how important, which distinguish one artistic approach from another.

The purist may tell us that the decease of stained glass is to be dated from the time of the introduction of enamel painting, but these wholesale condemnations are a little theoretic. and I should be sorry to identify any material with the power of causing such a catastrophe. The fact is the use of glass was diverted into new directions, towards the different requirements of more domestic use, and the medallion work of the later centuries must be judged on its own merits, and not in comparison with glass of an earlier time. In any case it is not reasonable to condemn its use, if there are any who would still do so. Its endurance is not quite that of pot metals, but there are plenty of examples of the late sixteenth- and seventeenth-centuries' enamel work still able to give a good account of themselves, and this is a longevity quite respectable enough fully to justify its use on technical grounds.

In my own case the merits of enamel for small medallion work are determined by results which have proved attractive to others, and which encourage me in its further development. But it is not only in its use for small panels but as an amplification of the ordinary methods of stained glass that I have found it very helpful. Such enamel treatment is, however, one of detail only, and as an addition to the traditional methods associated with the material it offers the means of taking results a step farther, adding a new dimension and combining the qualities of enamels with that of the pot metals. There is danger, I know, in theorising at all about such matters, but where one is in close touch with workshop practice and experiment and forms one's judgment on practical experience one may venture the view that the mingling of the two opens out new possibilities that have not yet nearly reached their full developments. It is a saying, the general truth of which cannot be denied, that we must accept the limitations of a material, and that in so doing we shall best discover its beauties. But do we always appreciate what these limits are? If we accept such a statement literally we may too easily become contented with the use and wont of custom in the matter. An open mind is still desirable, and the adventure of art should always interest us, and the adventure of glass is still at the beginning.

The glass used in the old medallions is often so thin that this has been a cause of injury to much of the work of former centuries, but as the result of experiments with thicker glass I have found some to take the enamels quite well, with no loss of transparency, and with the advantage to the permanence of the work lying in its greater strength.

I have no theories about materials. The justification of their use lies in results, in their reasonable permanence, in their charm and adaptability. And in this light the glass picture has its own particular place. For there are many others who, like the old sea-captain, wish to remind themselves of the associations in which their lives have been bound up—those most agreeably associated either with their labour or leisure. These, remembered in tranquillity as the scenes presented are viewed by them, whether the gallant ships of the old sea-captain or the sequestered hills and valleys which some of us have loved, are of the nature of poetry. keeping open that world of romance and beauty in which the best of life is for ever enclosed.

THE COMPLEAT ARCHITECT

By DUDLEY HARBRON.

XV.—PROPORTION.

Proportion is a distinguishing characteristic of all the arts. It is easy to recognise, though difficult to define. It appears to consist in an inevitable relationship to the human form, its needs, and the aspirations; in building, not solely to be looked at, but to live in, not only as individuals, but as groups. The relation between the various parts may be harmonious, yet owing to a disproportionate scale the whole may be too big or too small for human needs. When the points have been reached in either direction we feel no further gain in impressiveness nor concentration of effect. Models and monstrosities are equally ineffective. The first appear as toys, the others as stupid waste.

Modern sculptors have violated the canon of scale in minor respects in an attempt, by a disregard of the human form, to symbolise those qualities of mind and muscle which they feel unable to express except by distortion. They present a reaction against insipid exactitude. Though much may ultimately spring from this rebellion, its higher manifestations will be found to consist of that blend of internal and external experience which distinguishes the greatest artistic achievement. The thing from which they revolt is very much less art than their own revolution. Happily, architecture in England has avoided this wilful disproportion, though Europe generally is not so blameless. Whatever mistaken ineptitudes her votaries have practised they have not so far betaken to the jungle.

In simple words, proportion consists in being right and looking right. Looking right and being wrong is not beauty. Being right and looking wrong is no more complete than the proposition that practical men are artists. Fortunately, being right is a recognisable quality which in every one of its implications sums up a work of art, for looking right is one of the resultant attributes.

If feelings other than the artist intended to engender in the spectator crowd into the mind they will be usually traceable to some fault in proportion, due to over-insistence or neglect. It is common ground that mouldings have their quite justifiable uses, and that there is nothing more difficult than their proper selection; so much is the difficulty felt that more and more is their employment tending to the most obvious utilitarian simplicity, perhaps quite naturally as a reaction against their improper employment. Let us assume that we have an assemblage of such, simple or complex, quite impeccably correct: what justifies the artist in disturbing their placid faces by dints and delves called carving? Is it not when he feels that the subtle line of their section will be lost otherwise upon the spectator, maybe, in the street below? In order to aid the man in the street to appreciate the niceties of his perception, the artist helps him to recognise that which might otherwise have escaped his notice. If his carving assists the observer to grasp the artist's intention, is not the artist justified? If he does not, or idly wastes our time by distracting our attention, is he not equally condemned? Proportion comes into the problem solely out of consideration for impression upon the mind through the eye from normal viewpoint. Distance diminishes; adventitious aids are not necessary at the eye level.

How far the artist is in order in correcting the natural loss of significance by superfluous means is a delicate ethical problem. By "superfluous means" I mean an intentional employment of material more than structurally necessary. Nature does not provide the tree with bigger leaves on the topmost twigs, and nobody finds fault with trees on that account. Does not Gothic art reveal that this correction is not so essential as Classic art would have us suppose? The parapeted, coped conclusion to a wall is quite satisfactory. Quite so, you may protest, but Gothic art errs in that spires are no more necessary than cornices, yet they serve the end of emphasising verticality quite as adequately as a cornice does horizontality. In doing so they do not intentionally mislead. Cornices may project farther than necessary, supposedly to correct the diminution due to distance. Is not this an artificially imposed exaggeration, from which we are escaping by force of the necessity of extremes? If a skyscrap designed as a single order the proper c would overhang the street to a darkening dangerous extent. The cornice has h be clipped; indeed, the whole order wh is employed has to be superimposed in manageable proportions, upon a plain cliff-like series of lower stories, and scrapers have gained æsthetically in quence.

I hope it will not be inferred from thi I have any anti-Classic bias. I am onl ing to find a common denominator for p tion. There is as much proportion i poetry of Mallarmé as in that of Ro and both are art—the art of Mallarm the art of Ronsard. A work of art is finite, sizeable, bounded unit. It is n finity. It must have recognisable ext where the eye can pause, and say, "H finishes, here it begins." To be comp satisfying it should possess repose, a f inherent attribute of proportion. Goth is deficient in this quality; it is restless. portion should resolve the dynamic force a palpable static state.

There are more conterminous qualitie ing this conclusion—balance and a focal (that is, some point which satisfies the that it is the point upon which the orig intended the beholder to concentrate his tion, and from which he was to formula opinion of its rightness). If this is t follows that the object looked at canno perly consist of two equal parts, b between two likes the mind is ever f and hesitating confusedly, unable to d It must find unity, a unity doubtless in cases resolved from plurality, in orde the mind may be enabled to decide. relative importance of the wings and the the head, the body, and the feet are as part of architecture as they are of the n formation of birds, butterflies, or men.

Proportion seems to amount to a ciliation of the external needs with the feelings of humanity. If man had satisfied with Nature he would have rer in noisome caverns; he introduced bu when he heaped the stones about the into the form of a wall; proportion wl formed a reasonable dimensioned en therein.

IE ROYAL ARCHÆOLOGICAL INSTITUTE ANNUAL MEETING

By H. J. D. ASTLEY, M.A., Litt.D., F.R.Hist.Soc.

annual meeting of the Royal Archæolo- Institute was held at Winchester, from 6 to 23, under the presidency of Sir William Dawkins, F.R.S. Mr. A. E. Bolton was on. Sec. of the meeting and Mr. J. D. Le ur assisted as local Hon. Sec. The last on on which the Institute visited Win- r was in 1845, thought it has been in the ourhood several times since, notably at ampton a few years ago.

Winchester Cathedral.

Wednesday morning, the members, ering about 120, assembled in front of thedral, where they were met by the Dean V. H. Hutton), who had undertaken to n address on "The Place of Winchester dral in English History." Really, to deal the subject adequately, said the Dean, be to re-write English mediæval history, or 100 years Winchester ranked with n as practically the capital of England, aster festival being usually kept here by g. The history commences with Cynegils, st Christian King of Wessex, about 635, se reign the "Old Minster" was com- d and consecrated after his death by St. s. The bones of early Christian kings saints, including Egbert (837), Cnut, Emma, and many others, are contained day in the six Renaissance coffers standing parclose screens in the choir.

Dean then gave way to Dr. Hamilton son, who gave an architectural descrip- the Cathedral fabric. When speaking of am's association with the Cathedral, hompson remarked that Wykeham was kely to have been the actual architect; he not have had time to study architecture. rms of his last will showed that the master- to whom the work was entrusted was m Wynford, one of the most prominent -architects of the day. With regard to posed tomb of William Rufus in the choir, hompson had an open mind, though he t it more probably to be that of Henry of If Rufus was buried there, the actual would not be the original, because the fell subsequent to the burial.

he afternoon, the party re-assembled for amination of the Cathedral glass, and Couteur mentioned that the glass in the window, now much disarranged, was ly the work of "Glazier" of Oxford

Longstock.

Thursday, the members had an excursion west side of Winchester, proceeding first gstock, probably a Danish dock.

Danebury Camp.

camp on Danebury Hill, described by illiams Freeman, is the finest of Hamp- twelve contour camps, and stands bare chalk, 470 ft. above sea level, in manding position, half-a-dozen hill-top eing within sight.

Mottisfont Priory.

Mottisfont a Priory of Austin canons is said e been founded in the beginning of King reign. The foundation was intended for canons, which had decreased to three in hen the King, Henry VII, procured a bull ress the house, intending first to change a secular college, second to annex it to a l he proposed to build at Windsor. in 1500, the convent of Westminster had o take it over; but in spite of all these ns it continued to the suppression, when a Prior and ten canons with a clear of £124 3s. 5½d. At Mottisfont the were met by Mr. Harold Brakspear, who, after detailing the history as given conducted the visitors over the present and the remains of the Priory.

Romsey Abbey Church.

After luncheon at Romsey the party proceeded to the Abbey church, which was described by Dr. Hamilton Thompson. The great abbey of Romsey was founded in 907 for Benedictine nuns by Edward the Elder, and received a second foundation in 980 from Edgar the Peaceful and St. Ethelwold. The original Saxon church terminated with an apse at the east end, and there were two apsidal chapels on the east of the north and south transepts which survive. The presbytery and choir were lengthened and made rectangular somewhere between 1120 and 1140. The present presbytery, the crossing under the tower, the transepts, and the four eastern bays of the nave remain as in the Norman period; the three western bays are Early English of about 1240. The triforium is noticeable in that the tympanum of the arches is divided by a pier in the centre. The work of the eastern portion of the church is remarkably fine and uniform; the twelfth-century work of the nave shows some variety of design. There is a stone rood, built into the west wall of the south transept, which is generally accepted as a pre-Conquest work of art and remained over from the Saxon church. A curious carving of the Crucifixion, also probably Saxon, forms the centre of a reredos, in the south-east chapel. A mediæval picture painted on wood is in the north choir aisle and may have been part of the reredos of the high altar. This painting consists of several panels representing saints and bishops and was described by Mr. Rushforth.

In the evening the Mayor and Mayoress gave a reception at St. John's Rooms, at which the city regalia and Corporation plate were exhibited. None of the silver is older than 1720, but there are some very interesting pieces including a magnificent loving-cup presented by the late Lord Northbrook. During the evening a lecture on Roman Winchester was given by Mr. C. F. Fox, who described Venta Belgarum—the "market town of the Belgæ"—as one of the most important towns of Britain during the Roman occupation. He described the original fort on St. Catherine's Hill as the British oppidum, which, on being taken by the Romans, was made into a strongly-entrenched camp. Later on the Roman city was built in the valley where Winchester now stands, and became a centre of commerce for the whole district in peaceful times. It is now buried many feet below the present city and there are no traces of any Roman walls, though many remains of villas and public buildings have been found from time to time. The Rev. Dr. Astley said he was very glad to find that "venta" was now accepted as meaning a "market town," for not so many years ago it had been a subject of controversy, many of the older antiquaries asserting that it was quite impossible to assign any meaning to the word "venta." Canon Chanter put in a plea for the preservation of all existing ancient remains in the city, and hoped the West Gate would never be removed on account of modern traffic, as had unfortunately been the case with Temple Bar in London.

Winchester.

Friday was devoted to perambulations of Winchester. The first visit was paid to St. Catherine's Hill (328 ft.), a conspicuous rounded chalk hill dominating the Itchen valley and the city. The summit is crowned by a single circular entrenchment consisting of rampart and ditch, with a slight bank on the counterscarp. The only entrance which is clearly original lies on the north-east, giving access to the adjoining plateau; on the west the hill falls steeply to the river, and on the east and south there is a gentler slope. Dr. Williams-Freeman described the bank and ditch which enclosed the original British oppidum; the Romans would appear to have established a fortified camp here before building the city in the valley. The thirteenth-century chapel of St. Catherine is on this hill, and was a resort of pilgrims attracted by the relics of St. Birinus and St. Swithin, but its exact position is no longer known.

The Hospital of St. Cross was next visited, its history being given by the Master; the building was described by Dr. Hamilton Thompson.

The afternoon was devoted to visits to Winchester College and Wolvesey Castle. At Winchester College the party was received by Mr. Herbert Chitty, M.A., F.S.A., the Bursar, who described the college buildings; and the glass in the chapel and Chantry Chapel was described by Mr. Le Couteur. The College of St. Mary, founded by William of Wykeham in 1382 for "seventy poor and needy scholars and clerks, living college-wise in the same, studying and becoming proficient in grammaticals or the art and science of grammar," lies immediately to the south of the Cathedral. Possession of the buildings was taken in 1394 and the chapel was consecrated in 1395. The college is entered from the north through the great gate-house, over which stands a fine statue of the Madonna and Child, and is arranged round two quadrangles. The outer court contained the land steward's room, mill, bakehouse, brew-house, stores, slaughter-house and stables. All the members of the Society, which consisted of a warden and 70 poor scholars, were housed in the inner quadrangle, which also contained the muniment tower, the chapel, the schoolroom with dining hall over it, the kitchen, cellar and sacristy. The disposition of the muniment tower and chapel to the east, the school and hall in the middle, and on the west, the cellar, buttery, library, and other offices arranged together on several floors, and carried to the same height as the chapel, are specially noteworthy. This contrivance, peculiar to Wykeham's work, and repeated with appropriate modifications at Windsor and at New College, Oxford, lends a dignity and symmetry to the buildings which is unusual in work of that age. The visitors were allowed to inspect all parts of the College and were particularly struck by the size of the cellar and kitchen and the darkness of the students' rooms, each of which was assigned to four or five scholars, who had, and have, a special corner to themselves. Our forefathers did not pay much regard to light or sanitation, and our elementary school children of the present day are certainly housed much better than the scholars in Winchester, though no doubt old Wykehamists would consider it a heresy to say so. The chapel contains some remarkable glass; it was originally filled with rich coloured glass, at the cost of the founder, about 1393; the firm employed was that of Thomas of Oxford, whose portrait may still be seen at the bottom of the east window. This glass escaped all early troubles, but having fallen into a dilapidated condition, was, unhappily, entrusted by the warden and fellows (the east window in 1821–1822 and the side windows between 1825 and 1828) to Messrs. Betton & Evans, of Shrewsbury, who undertook to "retouch and restore the glass to its original brilliancy." This they did by making a careful and painstaking copy of amazing excellence, as regards the design, but, owing to their inability to obtain the proper type of glass, only very feebly reproducing the gorgeous colouring of the original. The east window contains a Jesse tree, the day of judgment in its tracery lights; at the bottom of the main lights are a number of portrait-figures, including Edward III, Richard II, and two representations of the founder himself, together with smaller figures of the carpenter, the mason (William Wynford), the clerk of the works (Simon Membury), and the glass painter (Thomas). The original bill for bringing glass from Oxford, 9 days, 12 horses and six men, amounted to 19s. 3d.

Wolvesey Castle was next visited and described by Dr. Hamilton Thompson. It lies within its own enclosure south-east of the Cathedral, and was built by Bishop Henry of Blois, as the Bishop's fortress; to his time most of the existing ruins, though not all of the same period, belong. A considerable portion of the keep and the great

hall are still standing. The masonry of the keep is remarkable for the use of small stone shafts as bonding. If Giraldus Cambrensis is correct in stating that Henry of Blois used the remains of the Old Royal Palace for the castle which he began in 1138, these may have come from thence, but they may have been taken from the old buildings of the new Minster when that foundation was transferred to the suburb of Hyde in 1112. The chapel of the castle, a fifteenth-century building, was kept in use after the other buildings fell into ruin, and was used in the building of the Palace erected by George Morley, Bishop 1662–1684. This beautiful house is an excellent example of the architectural style of its date and is now used as the church house. The remaining portion of the city wall encloses the east and south sides of Wolvesey Castle, and the line of the walls can easily be traced along the present streets of the city; two of the gates, the West gate and King's gate, remain.

At the evening meeting at St. John's rooms Mr. O. G. S. Crawford, F.S.A., read a paper on "Air Photography and Archæology," with lantern illustrations. These showed the lines of Celtic and Saxon cultivation underlying the modern fields and downs taken from a height of 8,000 to 10,000 ft. and form a striking adjunct to the science of archæology.

Before the lecture the annual meeting of the Institute was held, when the report for last year was adopted and the choice of Carlisle, Chester or Shrewsbury for next year's meeting was left to the Council.

Merdon Castle.

Saturday was devoted to a run through the New Forest, visiting Merdon Castle and Beaulieu. The first stop was at Merdon Castle, which was described by Dr. Williams Freeman. These earthworks lie on a gentle ridge at some distance from the summit of the hill, the position being of no great strength. They consist of an irregular British ring, inside which has been thrown up a Norman mount and Bailey castle. Where it remains, the British rampart is in good condition. As in other examples in Hampshire, the usual Norman mount takes the form of a circular work, with a saucer-shaped depression inside. The protective rampart of this mount is of great size, rising 29 ft. above the level of the ground outside, and protected by a ditch 20 ft. deep; compare this vertical distance of 49 ft. at Merdon with the corresponding figures of 69 ft. at Old Sarum, and 64 ft. at Castle Rising. Some fragments of a flint and stone tower, a deep well, and some remains of a retaining wall remain to tell us of the castle built by Bishop Henry de Blois in 1129; this is one of the so-called adulterine castles with which the country was covered during Stephen's reign, and was destroyed by Henry II about 1156.

Beaulieu.

The route was continued through the New Forest via Romsey, Cadnam, Lyndhurst, and Brockenhurst to Beaulieu. At Lyndhurst a short halt was made to enable the party to see Lord Leighton's altar piece of "the wise and foolish virgins," so justly celebrated. After luncheon, the visitors were received at Beaulieu Abbey by Lord Montagu. At Beaulieu the present house has been built around the great fifteenth century gate-house; very considerable remains of the monastery, which belonged to the Cistercian Order, still exist. The manor of Faringdon, in Berkshire, was given by King John, in 1203, to the Abbot of Citeaux to found an abbey of the Order there. In 1204 he changed his mind and founded instead the Abbey of Beaulieu, and the church was built sufficiently to allow the monks to enter it in 1227, but it was not finished and hallowed until 1246. The area of the church was greater than that of any other Cistercian church in England; it had an eastern apse with ambulatory, aisle and nine radiating chapels, and the north transept was double-aisled with a large Galilee porch across its north end. Nothing of this church but the lower part of the south wall of the nave remains above ground. The west end of the vestry, which was a book-cupboard, and the arches at the west end of the chapter-house, are standing. The frater is complete; it has a fine contemporary pulpit in the west wall, and has been used as the parish church since the suppression. Most of the cellarer's building is complete. The outer and inner gate-houses also remain, the latter is of the fourteenth century, and has the gate-house chapel on the first floor. Part of the precinct wall stands, and there are remains of a building, called the "wine-press," to the north of the church. The precinct and surrounding lands were sanctuary until the suppression, and those therein at that time were allowed to continue there for the term of their lives.

The abbey was described by Mr. Harold Brakspear, who pointed out the beauties of the remaining early English work of the thirteenth century, and compared it with the many remaining Cistercian monasteries in Yorkshire.

Porchester.

Monday was devoted to visits to Porchester, Titchfield, and Bishop's Waltham. At Porchester, the Roman station, castle, and priory church were described by Mr. Brakspear.

Titchfield.

Titchfield was visited in the afternoon and described by Mr. Brakspear. Titchfield, like Beaulieu, was given at the suppression to Sir Thomas Wriothesley, who changed it into a magnificent manor-house for himself; the letters respecting this work are printed in the *Journal* of the Institute, Vol. 63, pp. 231–243. Except the entrance gate to the house, planted across the middle of the nave of the church, nothing of Wriothesley's work survives, but a considerable amount of monastic work still stands. The cloister was on the north. The walls of the nave, which was aisleless, the west side of the north transept, the west end of the chapter-house, and the south wall of the frater remain, and are all of the date of the foundation. The abbey is now in the hands of the Board of Works.

Bishop's Waltham.

The concluding visit was paid to Bishop's Waltham, where the palace and church were described by Dr. Hamilton Thompson. The manor of Bishop's Waltham was an early possession of the See of Winchester, but the first house of the Bishops, of which remains exist here, was built in the time of Henry of Blois, before 1171. From this, at the north-west end of the site, the later palace grew into a large building; of this a considerable portion of the hall range, rebuilt in the fifteenth century, is left. The great chamber was in the tower at the west end of the hall, which incorporates the remaining part of the twelfth-century house. The remains of the apsidal chapel, south of the hall are also of the earlier date. The whole site was surrounded by a moat, and a brick wall encloses it on two sides. The palace was one of the chief residences of the Bishops, and here Wykeham and Waynflete died. It was surrendered to the Parliamentary forces in 1644, when it was dismantled and fell into ruin. The church at Bishop's Waltham has been so much rebuilt and restored at various periods that its mediæval features are a good deal obscured, but some few remains of the ancient church may still be seen.

Old Basing.

On Tuesday visits were paid to Old Basing, Monk Sherborne and Sherborne St. John, all in the neighbourhood of Basingstoke. At Old Basing the party were met by Mr. Brakspear, who described the church, the barn, and the castle. At Basing there was a Norman cruciform church of which traces can still be seen in the lower part of the central tower and the north and south arches. The aisles were added in the fifteenth century. There are some interesting monuments, including several of the Paulets. Sir William Paulet became first Marquis of Winchester in 1572. There is a good fifteenth-century font and a figure of the Virgin and Child remains unmutilated in a niche over t west doorway. The barn, which was no do a part of the original lay-out of Basing Hou lies between the present road and the ri Loddon. It is a fine sixteenth-century buildi with a good deal of later patching, and may compared with the great barn at Paston, Norfolk. Old Basing Castle stands on grou of no great natural strength, sloping gen to the valley of the Loddon from the nor west; on this side protective marshy grou reaches to within a hundred yards of t citadel.

The earthwork now consists of the circu rampart of the citadel, 80 yds. in diameter fr crest to crest; surrounded by a ditch 35 below it. This was thrown up shortly af the Conquest, and here, as at Old Saru Merdon, and other Norman castles, the us mount takes the form of a circular work, w a saucer-shaped depression inside it. Licer was given in 1261 to Robert de St. John strengthen his house with stockades. Bas Old House was built inside the citadel; it v of vast extent and was for the most part erec by Sir William Paulet, first Marquis of W chester, after 1530, at which date he procu licence to build walls and towers to fortify manor. The rampart was lined and surmoun with a red brick wall, and the interior nea filled with his work, consisting of a hall, he gonal kitchen, and other buildings, and a la gatehouse to the north; these were known the Old House, and the foundations are n undergoing excavation. The same Marq later on built a new outer gatehouse on west side of the bailey, and on the eastern p another great house, with a third gatehou known as the New House, was erected. Qu Elizabeth was here in 1560, and again in 16 when she stayed thirteen days, and apparer so nearly ruined the owner that he forthw started to pull down part of the house, evider that the same honour might not be confer upon him again.

Basing Castle is celebrated for the two ye siege it underwent in the Civil War, 1643 which was ended by Cromwell in the la year, after a two hours' fight.

After lunch at Basingstoke the Priory Chu at Monk Sherborne was visited and descri by the Rev. G. Sampson, the Rector. T Priory was founded by Henry I as a cell of Benedictine Abbey of Saint-Vigor, Cerisy, Normandy. At the suppression of the A priories, Monk Sherborne was granted to Que College, Oxford, by whom the Priory and endowments are still held. The central tc and choir of the church are the only p now remaining, and are used as a parish chur the aisleless nave has disappeared with exception of the south wall, which now fo a garden boundary. There is a curious woo cross-legged effigy of John du Port of 1 several early coffin slabs, and a pre-Reforma bier. The great mansion, known as " Vyne," at Sherborne St. John, was r inspected and described by Mr. C. L. Ch M.A., as the closing visit of the day. The h was begun early in the sixteenth century William, Lord Sandys, and was much alt and enlarged by Inigo Jones.

Hyde Abbey and Great Hall.

Wednesday was occupied in visits to H Abbey gatehouse, the great hall of Winche Castle, and the Museum. In the aftern members visited St. John's and St. Pet Cheesehill, churches. The gatehouse at H Abbey, described by Mr. F. Warren, is all remains of this foundation. The abbey originally built by Bishop William Giff in 1109, in Hyde Mead, to replace the Minster which had proved to be inconvenie near the old minster of St. Swithin. At dissolution, the whole abbey was pulled d and on the site a gaol was built in 1788.

The great hall of Winchester Castle, whi all that remains of that great fortress buil the Conqueror, was described by Sir Wil W. Portal, Bart., F.S.A. The whole castle been swept away and buildings erected on

with the exception of the great hall, the of a tower, and traces of the ditch, and an esting underground passage leading to a -port. The castle was the principal resi- e of all the early kings, and on its site les II built a great palace with the intention iving there.

he great hall (111 ft. long, 55 ft. wide, and . high), originally Norman, was altered 235, and again in 1380; the roof is sup- ed by two rows of Purbeck marble columns. he west end of the hall, over the remains e Norman dais, hangs the celebrated Round le of King Arthur and his knights, 18 ft. ameter. The table, however, actually dates the thirteenth century, and was repainted he time of Henry VIII. The Parliament sat in this hall for nearly 400 years. Until 1874, when new courts were built, it had long been divided into civil and criminal courts.

This concluded a most successful week. Great credit is due to Mr. A. E. Bolton for the excellence of all the arrangements, and the fact that the proceedings passed off without a single hitch is largely due to his untiring efforts and unfailing courtesy. Thanks must also be accorded to all the organisers of the meetings and to the various lecturers whose descriptions and papers gave so much valuable information. A most attractive book of the programme, with maps and plans of the principal earthworks and buildings, and full of information, had also been prepared by Mr. Harding-Tyler and the members the meeting committee.

Bank of England Reconstruction.

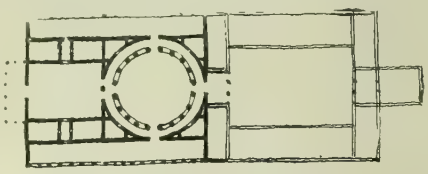
The following notice was recently posted outside the Bank of England, headed "The London Building Act, 1894: Height of Building": "Notice is hereby given that the London County Council did, on the 28th day of July, 1924, consent to the erection of a building at the Bank of England, Threadneedle-street, Prince's-street, Lothbury, and Bartholomew-lane, of a greater height than that prescribed by the above Act."

It is understood, however, there is no intention of demolishing Sir John Soane's building, but the notice is posted merely in requirement with the regulations in connection with the intention to increase the height.

Medallion Windows. By Mr. Reginald Hallward. (*See p.* 237.)

PLINY'S VILLA AND WHITEHALL PALACE*

By W. R. LETHABY.



THIS volume is the work of the assistant Professor of Classics, Hunter College, New York. Her interest in Pliny's Villas "began with a desire to make the whole subject of the habitations of the Romans clearer." She not only collected what had been written, but studied existing buildings. "I learnt from my travels that a visit to the Villas throughout Italy, even to those built at a later date, helps us to understand the ancient establishments as descriptions alone never could. I determined to collect and compare the various reconstructions. The more I gathered, the more I enjoyed my search, and I came to the conclusion that it would be a pity not to make this material easy of access."

The gathering of material must be very fully done, and I should like to echo what is said in an introducing foreword: "Encouragement should be given to those who are willing to give discerning effort to bring together information which is not original but which is useful as a tool in the process of study. We are therefore indebted to the author for placing in one volume opinions of various scholars on the Villas of Pliny."

The solutions are so varied that they bring out the fact that no very exact reconstruction may be made. Pliny's text is short and chatty, and what can be gained from it is rather a list of names and uses than the disposition in a plan. The description, however, begins with the chief parts along an axial line, beginning with an atrium and ending with the triclinium, which projected so that views of the sea were obtained in three directions. The axial vista was so perfect that on turning around at the further end one might look back through the atrium to the woods and distant hills. One of the other most interesting features was a tower three stories in height, of which the top story was occupied by a dining-room. Tower-like erections appear on many paintings and mosaics which give views of Roman houses, and it is probable that some of the greater Roman villas in Britain had such towers.

It ought, perhaps, to be said that the use of such terms as "ante-room" for *cavaedium*, and "bay-window" for an apse with windows, does not inspire confidence in the rendering of technical terms in Pliny's text, but translation is not my business. The method of making a complete study of some one monument is to be strongly commended to our students, and it occurs to me that it might be stimulating if some educational body drew up a long list of possible subjects by way of suggestion. I would begin by the antiquities of every town and village in the country; every student might be "the greatest living authority" on some monument.

I have been specially interested in this book by finding reproduced among the plates—the first, in fact—a restoration made by Scamozzi and published in his *L'Idea dell' Architettura Universale* (Venice, 1615). After mentioning the atrium, Pliny proceeds *deinde porticus in D litterae similitudinum circumactae*, by which the earlier restorers understood a circular or elliptical wall enclosing a round or oval court. Scamozzi shows a large circular colonnaded passage set in a square, the angles between the circle and the square being occupied by staircases: the colonnade is not open to the central area except by doorways in the four cardinal directions, the other bays have windows in the enclosing wall, above are an entablature and a balustrade with tall statues standing on its dividing piers. Some six years ago I saw this engraving and recognised at once that it was the source for Inigo Jones's scheme for the palace of Whitehall. I have referred to this before, but the present republication of the plan gives me an opportunity for speaking of it more at length. I say Inigo's scheme, but this is disputed, and it is claimed that the full design for Whitehall Palace was the work of Webb, who had been Inigo's assistant. Now, although it does not amount to proof, it will, I think, be generally agreed that the taking over of this design is

Pliny's Villa, Scamozzi's Plan.

more likely to have been the procedure of Jones than of Webb. The façade of the banqueting house is a close imitation of a Venetian front, and Inigo has noted that when he revisited Italy in 1614, he saw and spoke with Scamozzi, and it is not improbable that the Italian master showed him the plates for his work. I have also pointed out on some former occasion that the large staircase blocks of the design for Whitehall Palace contain double spiral stairs, devised after the manner of those at Chambord, and we also know that Inigo visited that palace.

When we consider these facts together with the traditional view that the Whitehall plan was the work of the older master, and with the likelihood that Inigo would have made complete schemes for a palace of which the Banquet Hall was admittedly only a part, we shall find a strong case against the new criticism. Webb may have been the draughtsman for existing plans, but I cannot doubt that Inigo Jones was the designer.

BOOK REVIEWS

The Cathedral Church of England. By W. B. TUTHILL, M.A. (London: The Macmillan Company.) Price 10s. 6d. net.

As is generally known, a great number of the cathedral churches of England were not built for the particular purpose they now fulfil, but have been devoted to that purpose in the process of time on account of the creation of new sees. Most of them originally formed the churches of conventual orders, or collegiate bodies. Some became the episcopal seats of new dioceses while still retaining their conventual status, as in the case of Ely; five of them, Bristol, Oxford, Chester, Gloucester, and Peterborough, became cathedrals of new sees on the suppression of their monastic orders in 1539; while others, as Manchester and Southwell—both collegiate churches—have been made cathedrals in modern times. It is, therefore, impossible to treat the cathedral churches of England architecturally as though they belonged to a particular class of building to be compared with others of a similar class elsewhere. The plan, general arrangement of parts, position of doors, disposition of cloistral buildings, and the whole character of the structure, bore direct relationship to the particular requirements of the conventual body by whom it was to be occupied—Benedictine, Cistercian, Augustinian, &c. The architectural requirements of a cathedral chapter, in regard to the church and chapter house, differ so little from those of a monastic body that little or no alteration is necessary in the conversion of an Abbey church into a cathedral.

The book before us is an extended essay in which the cathedrals of England are treated as forming a class, and compared with Continental examples. As a result of this method of examination, without reference to the particular purpose for which the church was built, we give one extract: "Some [*i.e.*, the English cathedrals] can lay little claim to be of inspired design, and in other instances, were it not for the surroundings, they might be considered ordinary. For instance, the cathedral church at Manchester is a commonplace building without distinction for size, or without any vicarious help from the constructions or areas about it." A discussion of the various phases of Gothic architecture and remarks on the plans, positions of doorways, transepts, towers, &c., is followed by notes on individual churches.

A History of Ornament, Renaissance and Modern. By A. D. F. HAMLIN, Professor of the History of Architecture in Columbia University. (London: B. T. Batsford; New York: The Century Co.)

The treatment of a subject such as the history of ornament, so that it can be presented to the public in a convenient form but still in some measure cover the ground attempted, presents enormous difficulties. Not only is it necessary to traverse the whole field of the decorative arts, but selection must be made in every quarter from a prodigality of varieties and examples. Particularly is this so in respect to the periods reviewed in this volume, and it was therefore considered advisable to exclude from it all reference to the wide field of Oriental art. The present volume is the second by the same author, the first dealing with ancient and mediæval ornament. After a sketch of the history of Renaissance art in general, the development of ornament is traced in Italy, from the early Renaissance to the Italian Baroque, and in France, Spain, the Netherlands, Germany, Great Britain and America during the same period. The final three chapters are devoted to the work of the nineteenth and twentieth centuries in Europe and America.

About one-third of the volume is devoted to the productions of the Italian schools, the sources and inspiration of all Renaissance art. Although the beginnings of this art may be traced to periods well back in the Middle Ages it was not until the fifteenth century that the movement became definitely established. But from that time it became supreme in Italy where the classic traditions had never been entirely abandoned, and under the great masters, Brunelleschi, Lorenzo Ghilberti, and Lucca della Robbia, art received a new impulse which was destined to have a world-wide effect. Generally the forms of Italian Renaissance ornament were architectural in character, and, although they find expression in all the decorative arts, that character predominant, and is to be observed particularly in such work as the carving and inlay of church stalls and of domestic furniture, and, indeed, in almost all branches of decorative work. This is principally due to the astounding versatility of the artists employed in the work—who were at once architects, sculptors, painters, and workers in wood and the precious metals. Most of the fundamental features of decoration adopted by these early masters of the Italian Renaissance may be traced to Roman prototypes, but the artists were no mere plagiarists. The general composition of the ornament is so changed and the proportions and character of the details so varied that the design is practically original and the effect produced entirely new. Thus the acanthus leaf, the egg and dart, the dentil and the modillion were varied and transformed in an infinite number of new forms, the grotesque and symbolic figures of classic ornament were employed with great freedom of drawing and given a new significance, and the festoons, wreaths and masks of Greek and Roman ornament also provided the inspiration for similar forms of a more elaborate character. For the just and due relationship of all the various elements of a design to the composition as a whole, the proper distribution of ornament over the whole space to be decorated, is never lost sight of by those artists of the Italian Renaissance, and their work therefore forms an invaluable field for the study of this subject.

The productions of other countries and periods are also reviewed, but in a more cursory manner. The illustrations throughout, photographs and drawings are profuse and excellent: four plates of illustrations are in colour. There is also a useful bibliography

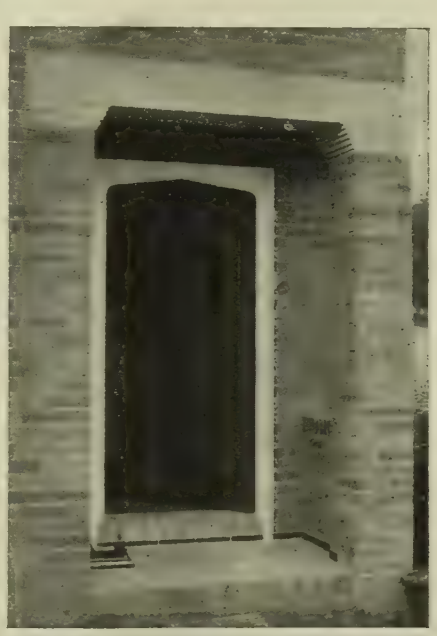
LONDINIUM *



Professor Lethaby, writing of the Roman city of Londinium, from which our London has been evolved, does not confine his outlook altogether to archæology. He is ever on the alert to discover what practical lessons applicable to present-day affairs may be drawn from the historical details his researches enable him to lay before his readers. Londinium differed immensely from the London of our own time, but the contrast of Roman and modern methods is not by any means always in our favour. The arts of Roman Britain were admittedly tinged with provincialism, and depart very considerably from the standards of Classic art as they appear in the text-books: they were, however, often instinct with sound sense, without which quality the finest proportion and the greatest delicacy of execution may become merely wearisome. One department in which the Romans in Britain showed their excellence was in the setting out of inscriptions and adjusting the beautiful capital letters of their alphabet to occupy a space and be at once legible and decorative. Several examples are mentioned and illustrated, including the beautiful inscription from a Roman tomb now preserved in the entrance of the chapter house at Westminster.

The part played by the tool in the finished work is indicated by the author in the illuminating sentence: "The chisel, like the pen, is thin and wide, and thus perfectly fitted to develop the habit of the pen. The cut letters were themselves usually finished by painting. Whoever wishes to design inscriptions must begin on the writing basis, and I should like to advise every student . . . to take up the practice of writing capital and small letters with single strokes of the pen, not 'touching up' or 'painting' the letters, and, above all, not 'designing' them with high-waisted bars, swollen loops, little-headed S curves, and other horrors of ignorance and vulgarity, but learning once for all a central standard style." The use of colour was not confined to inscriptions, but appears in every department of architecture. Alternate courses of red and yellow bricks and ruddy mortar composed of ground-up pottery introduced colour into ordinary building, while mosaics, wall paintings, and painted statuary carried the colour scheme into the decorative details. In his chapter on sculpture the author seems to share Wordsworth's appreciation of the beauty of natural things as seen by Pagan eyes, but obscured for us by our so-called civilisation. "In Roman days," he writes, "every place and almost every field had its *genius loci*—an idea which we still timidly preserve as a figure of speech. Many British inscriptions and sculptures relate to Silvanus, rivers, and fountains; to the deities of the fields of Britain (think of that now!), to nymphs of the springs (think, again, of ours choked with tins and old shoes), and to the god of ways and paths (perhaps such an image would do some good at Liverpool-street and King's Cross)."

The embodiment of the civic unit in a statue is also praised. "Our French friends, in their images of the city of Paris or of Strasbourg, still make use of the idea, but we have ceased to know that a city is more than a congested area where landlords hire out what they call houses. I wonder if London were given an image whether it might not acquire a new sense of soul." The encouragement of public tidiness may well have been an auxiliary motive for the erection of symbolical statues in Pagan days, but manners have changed since then, and it may be doubted whether we are not now far too cultured to take kindly to such a useful suggestion. The statues we possess at present are only kept clean by the care of the police and the periodical labours of public bodies, such as H.M. Office of Works and the L.C.C. The many neglected war shrines up and down the country give ground for the prediction that an unprotected statue in a rural area would soon be made to serve as a nucleus to the village dump heap. The characteristic severity or brutality of the Roman has been so often remarked upon that readers will be surprised as well as delighted at the more humane side of Roman life expressed in some of their carvings and sculptures illustrated and commented upon in the book. Constructional methods are ably described, and the author's praise of the hypocaust system of heating in vogue, not only in the hot baths but in the private houses of the citizens, may give a hint to modern heating engineers. East and West are shown to have been united in the tradition of city wall construction. The same precautions adopted in England to make the bastions act in conjunction with the curtain wall despite possible variations in their respective rates of settlement may also be recognised in the walls and towers of cities in the Near East. This large-minded treatment of structural expedients is fully described in Professor Lethaby's book, and makes delightful reading in these niggling days, when constructional interest has been boiled down to the minutely tabulated strengths of steel joists and riveted connections. The text is illustrated by a great many explanatory sketches by the author.

Readers of *The Builder* will recognise in the book the series of articles which appeared in our pages in 1921.

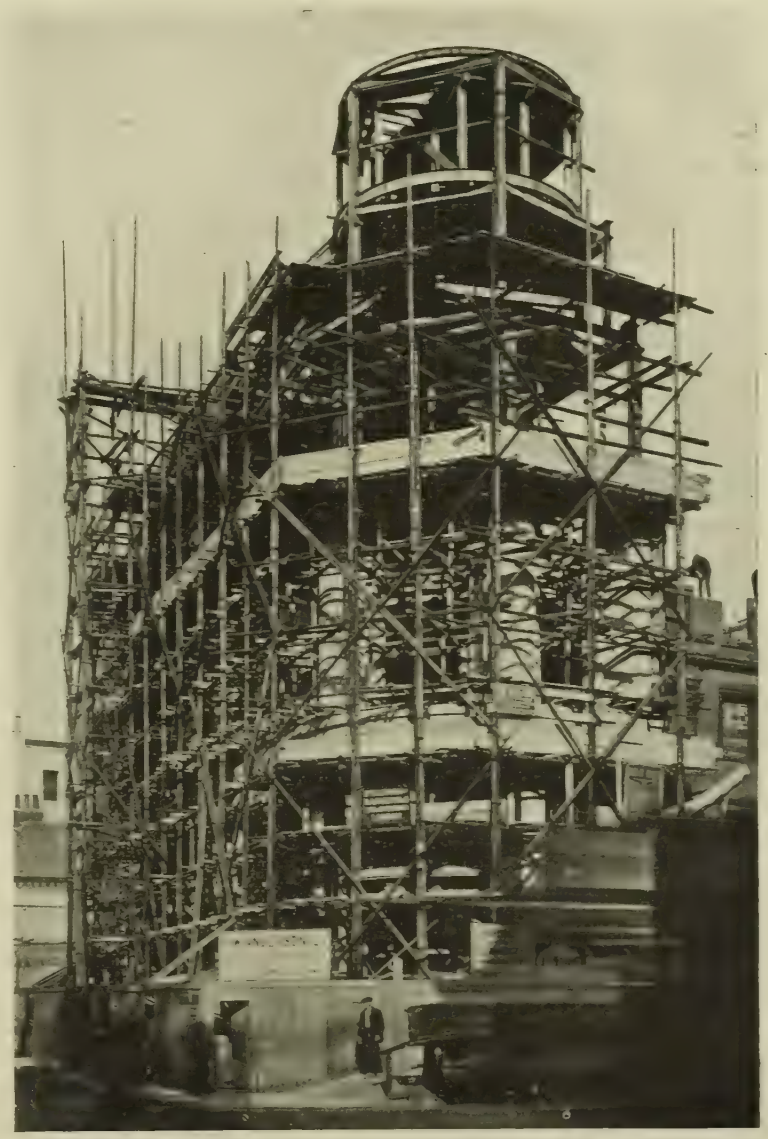
TEACHING ART AND HITECTURE OF WALES

ıe opening meeting of the Honourable of Cymmrodorion at Pontypool "The g Art and Architecture of Wales" was d.

Lord Treowen had opened the meeting, Villiams-Ellis, addressing the meeting on Architecture," said of all the arts the ily expensive one of building required ge, and so long as they were numb and ve to good building, so long would they they deserved—ugliness, meanness, and incompetence. If they had only half a nthusiasts to spend their time going he schools, elementary and secondary, g the gospel of beauty, they would soon nation in which architecture and the ual arts could thrive. If they as the served good art and good artists, good ure and good architects, they would n. In Wales at present they were ned to mean and incompetent architec- Fortunately there were a few really good Welsh buildings, as well, of course, as ble old ones, to console the minute ublic that did care.



. Trystan Edwards, A.R.I.B.A., urged rability of instituting a class in the d forms of secondary schools and l colleges which would have as its object eration of the social function of the visual y this means architecture, painting, and e, and the other branches of design e better correlated, and the student e encouraged to consider how best he ake use of the technical gifts he had . What they saw to-day was very chnical proficiency in all the arts, and y of those modern works were lacking ral value. In architecture one of the tragedies was that very great skill in tion, and superb craftsmanship were asted upon the most vulgar designs. edy was not still more lessons in con- and craftsmanship, but more considera- he social qualities of buildings, what e described as their deportment, the deference which one building had for and for the city of which it was a part. a question of civic order on which the public was competent to express an

tics, however, like artists, did not grow wn accord. They must be trained, and was the hey-dey of bad artists, one s that they had an insufficient number ritics.

. Alwyn Lloyd, F.R.I.B.A., said a got the architecture which it deserved, ld never produce fine buildings unless a public sufficiently educated to appre- cherish them. The new School of ure for Wales at the Cardiff Technical as not yet as widely known as it should as doing a fine pioneer work in difficult the encouragement given to it by such s as the present one, and by the terest by those who had at heart the nt of the right spirit in relation to the re of Wales was very welcome. It was e having the most perfectly organised ss it was backed up by an instructed nion. He hoped that in Wales they satisfied with nothing less than the small country with splendid traditions to the spiritual aspirations of their y had an opportunity which was not ven to larger countries. One would a new movement for fine craftsman- he creation of an æsthetic sense grow- their traditional peasant culture and of the beautiful in religion, music, and which they felt so proud, supple- the love of art. Much could be done, the training of students by the Architecture at Cardiff, in the way of or non-professional people and of s. Classes in building construction, ng, and craftsmanship should be in on with the School of Architecture, rather than run as separate departments, which, he believed, was now the case.

Mr. W. S. Purchon, M.A., A.R.I.B.A., head of the Department of Architecture and Civic Design in the Technical College, Cardiff, dealt with the teaching of architecture in Wales, and referred to the establishment and work of the Royal Institute of British Architects. About four and a-half years ago the School of Architecture at the Technical College, Cardiff, was started on lines modelled on those of the older schools in England, with a three years' full-time day course, followed by two sessions of six months each, spent at the college, the intervening six months being spent in an office. The school was already "recognised" by the R.I.B.A., which granted exemptions from its own intermediate examinations to students who passed with success through the three years' course. Some of the students had already obtained the associateship of the Institute, and a number of them had passed the R.I.B.A. intermediate exam. Two students had held the R.I.B.A. Henry Jarvis Ex-service Travelling Scholarship, and good work had already been done by students in the school in the study of worthy buildings in Italy, France, and in Bath, Cambridge, and London, while through the efforts of students in the school Wales was enabled to be well represented in the great exhibition of the work of students of architecture recently held in London. A certain amount of work had already been undertaken in the direction of stimulating interest in architecture by the giving of lectures to High School students and the public.

If the response to the offer of prizes for architecture in connection with that Eisteddfod had not been satisfactory it was due in all probability to the reasons which were leading the R.I.B.A. to reconsider its great and important prize scheme. It was important that such prizes be awarded in Wales, and it might be suggested that they should be of two kinds, one for the best actual building or group of buildings designed and completed by an architect, the other for the best design submitted by a student and prepared during the normal course of his studies. The future development of architectural education in Wales would be best achieved by concentrating on one really strong and vigorous school. If possible, and it would be possible if any difficulties in the way were treated as difficulties ought to be treated, degrees should be awarded to the successful students. Such a school would not only provide an adequate professional education, but would also have a valuable influence on the various allied arts and crafts. Facilities should be given to non-architectural students to study living art, such as architecture in working for the arts degree.

Vigo House, Regent-street, during Construction.

Sir J. Burnet, A.R.A., & Partners, Architects.

[This building was illustrated in our issue for May 16.]

A HOUSING SCHEME

We have received from the Greenock Housing Council a copy of a scheme which is described in a covering letter as being put forward as a constructive proposal towards remedying the present national deficiency in housing. We do not find the proposals as outlined in the scheme very easy to follow, and if we do not adequately describe them it will be from lack of apprehension and not from intention.

We understand that the authors of this scheme in the first place take exception to the Government scheme on the ground that the charge on the local rates will vary in localities whilst they contend it should be equalised. They put the charge on every house built under the Government scheme as representing a demand on the rates of 2s. a week, or £5 a year, falling, when the scheme is completed, to at least 10d. on each house, and this burden, they contend, will be unfairly divided as between industrial and residential districts. We understand the proposal to be that at any rate this burden should to some extent be equalised and that it is suggested that if the weekly premium of the 15 million contributors to National Health Insurance were raised by a penny, three million pounds would be raised by that method, whilst an extra 2d. on the Income Tax would represent 5¼ million pounds, or 8¼ million pounds in all. Taking the Government statement that each house is to cost £500 and be rented at 9s. a week, the authors of the scheme then say that the above sum of 8¼ millions would build 16,500 houses, and as these houses would be free of "bond or interest," the 2s. a week in rates would be wiped away.

So far this statement can be easily followed, and it is only necessary to point out that the only sum from fresh sources brought into operation is the proposed 3 million pounds derived from the contributors of Health Insurance, for the other 5¼ millions derived from Income Tax is only another way of proposing an increase of the subsidy of £9 as laid down by the Government scheme.

Under the Council's scheme the 16,500 houses erected out of the above fund of 8¼ millions being interest free are treated as revenue producing, the report of the scheme says: "They would provide a revenue for the Building Scheme. Put it as low as £7 a house per annum and you have a new contribution of at least £115,200, increasing annually by that amount. At the end of 25 years you have a sum of £2,927,000 from that source alone for one year, with a total for the 25 years of over 18¼ million pounds and the existence of 418,000 houses."

The scheme, it is admitted, would be too slow in the production of houses by itself and the report contains an account of how the scheme would operate in conjunction with the Government scheme. We give this in part.

"120,000 houses annually are to be built at a cost of £500 each. At the end of fifteen years, there are 1,800,000 houses, of which 325,000 are interest free and paying their way. The remainder are bearing a burden of at least £20 interest each. In ten years more the 3,000,000 are built. This scheme of ours has put in 418,000 interest-free houses, while the rest are costing in interest £48,000,000. Our scheme continuing pays off the burden on 16,500 houses annually by annual contribution, and almost 6,000 houses from the profits of non-interest paying houses. This annual 22,500 change over of houses from interest-paying to debt-paying means a progressive increase in the clearing of the debt scheme. In five years 115,000 are freed. In the next five years, 123,400, and in the next 132,000—a total in fifteen years of over 370,000 houses additional at interest free. In all a quarter of the three millions stand as a profitable national investment. If one adds the advantage of having the building scheme made national in a true sense, the advance on previous proposals is clear."

In this comparison the Government scheme houses are treated as follows. We quote from the Report. "It is to be noted that the figures officially given allow on each house interest charges of £22 10s., and a local rate of 2s. per week, equal to £5 4s. per annum." Then it is stated, "A house interest free would, on the same rental and without a local rate, show a profit of £17 6s.," and it is claimed that the figures on which the scheme is based are too low, for a "profit" of £7 is the basis of the £115,200 given above, and, therefore, either the rent is placed too low, or, alternatively larger results could be achieved.

As we have said, we find the scheme as outlined in this report difficult to follow, and we hope we have stated it fairly; but if we have read the scheme aright then there is this fallacy: the houses treated as "non-interest paying houses" and as yielding revenue are only distinguishable from the Government scheme by being paid for from two sources (the Health Insurance contribution and an increase in the Income Tax), which do not bear interest. The only new source of revenue is that levied on the Health Insurance contributors, which is put at three million pounds in the first year. In the White Paper, the contribution to the Government scheme from charges on local rates commences at £135,000 in 1924-5, and mounts to three millions in 1930-1 still rising, but in the years 1940-1 to 1963-4 it amounts to an annual charge of eleven-and-a-quarter million pounds.

Thus this scheme starts with a larger contribution for the first six years out ide the Exchequer contribution, and it is not levied on any territorial basis, but how it can be said to be revenue-producing is difficult to be seen. It is no more revenue-producing than is the Exchequer subsidy, which gradually mounts to £23,156,000, and we cannot see that it can be called revenue-producing because the sums are raised by taxation and do not bear any interest, any more than can the subsidy itself, or that the result is different except for the contribution from Health Insurance from what it would be if the Exchequer contribution was simply raised at once.

If the whole sum were thus raised, all the houses built could, as it appears to us, equally well be termed "revenue-producing houses" simply because they were built at the taxpayers' expense and the rents obtained were treated as revenue. If we have failed to comprehend the scheme we apologise to its authors.

LAW REPORT

Alleged Red Oxide Unusable.

In this action, held recently before Mr. Justice Snagge, Messrs. Hemingways & Co., Ltd., Stratford, colour and chemical manufacturers, sued Messrs. Nuroads, Ltd., King's Cross, flooring and paving contractors, to recover £12 13s. 3d., for red oxide supplied. There was a counterclaim for £8 10s., as damages for loss sustained, owing to the red oxide being defective, and not suitable.

Mr. A. Cohen, barrister, appeared for the plaintiffs, and Mr. Shelley, barrister, for the defendants.

Mr. Herbert John Jones, general manager to the plaintiffs, said that in February they sent along a sample of red oxide, suitable for jointless flooring, and in all they afterwards executed four orders, at varying prices, 14s. 10d. per cwt. and 14s. 6d. The goods were sent to Wicklow-street, and to Towcester.

Mr. Shelley here interposed, and said that they only complained of the last two deliveries, of 5 cwt. each, and they did not complain of the chemical composition, or the colouring power, but simply that it was lumpy, which had caused a lot of labour to pulverise. He produced a box, containing some of the red oxide, some of which was in lumps larger than a walnut.

Mr. Jones picked up several of these lumps, and crushed them quite simply with his fingers, and said there would have been no difficulty in doing this at the time of mi with the ingredients. The lumpiness a from compacting into bags, or by the pres of weight of bags on bags in transport. The oxide was used with various ingredients to n a jointless flooring, which was the sam linoleum. Magnesite was mixed with oxide, on a floor if done by hand, by m of a spadeful of each alternately. Any lu would run down the mound, and could broken up by the shovel quite simply. might be that there would be little pe lumps left even then, but at the finish of mixture it was mixed with magnes chloride, and when in this wet state lumps of red oxide would disintegrate.

At the resumed hearing of this case, Jones mixed a quantity of the red oxide magnesite and it appeared as if the red broke down when wetted.

Mr. Webb, a manufacturer and laye jointless flooring, said that in March April he had consignments of red oxide the plaintiffs. The March consignment a bit lumpy, but he used it all, and not was wasted. He mixed his by hand. there were lumps of magnesite, or colour, would roll down the sides. Magne chloride would break down lumps, but it no use to experiment as had been done all the ingredients had to be there.—In c examination, he said a sample produced one per cent. in colour to 30 per cen other ingredients, which showed that lumpy stuff could be used with no trouble. Ever since he had started in ness, since August last, he had had al red oxide from the plaintiffs, with no plaint as to colour.

After further evidence the case for plaintiffs was closed.

For the defence, Mr. Garrow said he had twenty years' experience in jointless ing, and besides was a technical che He was told that lumps of red oxide supplied in the bulk, and if such were case, it would be useless for jointless floo as the presence of the lumps would rende colour unsuitable. It had to be powder finest ground, or you could not get a suc ful, even mixture. The mixing of colour one of the most difficult things imagin The effect of a lump on the jointless flo would be that it would show as a lump the floor would be spotted. There wa thing except force to break down lumps. tainly magnesium chloride would not as that was really the cement, and it get round the magnesite and oxide, and a ball. He thought the lumps had caused by pressure and damp.

After further evidence the case for th fence was closed.

In giving judgment, Mr. Justice S said the amounts claimed could not be of moment to either firm. It resolved into the question as to whether the red was reasonably fit and merchantable. did not complain of the chemical compo or the colour, but of the lumps, which bad results. The defendants' foreman up a mixture which turned out not satisfactory, but yet it was sent out. thought the red oxide should not be l and therefore it was not in accordance the contract. The defendant succeeded fore, on the main issue, but it was d to know how to enter judgment, as the tiffs were entitled to something for the red oxide, whilst the defendants were en to their full counterclaim, which more wiped out the claim. Finally he gave ment for Messrs. Nuroads, Ltd., on counterclaim for 13s., with costs on scale, and awarded the plaintiffs nothi

Hydraulic Power in London.

A map of Central London showing the under which their mains are laid has issued by the London Hydraulic Power Hatfield-street. S.E.1.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

Ve are glad to give questions and answers annot accept responsibility for contributed s, especially on legal matters.

y we appeal to our correspondents to it their queries on paper of a size easily and written as legibly as possible, or still, in typescript?—Ed.

Drainage.

.—I am interested in the letter from itary " in your issue of August 8, reply- Mr. Thomas Tile, on the question of ge. Your correspondent obviously recog- the insuperable objections to cesspools, with or without overflows, the former rous to health, the latter costly to the for upkeep purposes.

ould, however, suggest that your corre- ent is under a misapprehension when he ts that this difficulty may be overcome by option of a septic tank and when he goes state that the effluent from such a septic is almost pure. Any form of cesspool ge constitutes a septic drainage system, ny septic system of drainage must be panied by the insuperable dangers and ons which always attach to a cesspool, and should be prohibited by council by-laws. action is only required in connection sewage purification to break down the matter, and should preferably only act solids, not upon the liquids; hence the ity for the digesting chamber to be as as possible. This digesting chamber or tank is only the first step in the purify- ocess; it should be the smallest, and is ast important.

real purification must be produced by bacterial action which is the antithesis ic action. It is an oxidising and nitrify- ocess carried out in a filter bed of ade- capacity, provided with proper distribu- r the liquid to every portion of the bed, ways aerated so as to allow the aerobic a to exist. This combination of a small tank with an adequate oxidising filter oduce an effluent of any degree of purity, nay be passed into any ditch or stream, to the Thames, or disposed of by sur- subsoil irrigation without any danger uting the ground.

explanation of the modern system of purification may perhaps be useful and event the unconscious use of a phrase night give to an intelligent reader an tirely contrary to that which no doubt shed to impress.

Jas. Edw. Tuke, M.R.S.I.

ement and Other Foundations.

-We are sure that the letter you print issue of August 8 from "Clerk of will arouse mixed feelings in the of your readers. If this letter is a t of fact, and not a joke, and there is living and in charge of the construc- a memorial a "well-known archæolo- who requires for foundations not con- t "flints or small stones, a certain of fragments of brick or sand, and laked lime," the whole of which is to and "used without delay," then the t thing that can be done is to let us name of this archæologist in print over who it is that is responsible for a gentleman with such extraordinary charge of such an enduring piece of a memorial. We are suffering every the bad material used in old-time ons, but that we should be asked to perpetuate the mistakes our forefathers made in ignorance and to hand on the same set of troubles to future generations is really unbelievable.

T. H. Clarke.

London.

Bungalow Extension.

Sir,—Will you kindly give me the following information through the medium of your valuable paper?

Regarding breeze and cement blocks (slabs), are they strong enough to form cavity walls in the building of a bungalow? Are they durable? Are they when well made damp resisting if the outside part of the cavity walls is "stuccoed" or rough cast? Are they quite satisfactory if used in the construction of fireplaces and chimneys without the part use of bricks? What should be the proportion of cement to breeze to make a good sound "slab" (or block)? What should be the thickness compared to the length and breadth?

Failing the satisfactoriness of the breeze and cement slabs for both inside and outside of the cavity walls, would a part use of them be satisfactory, viz., using bricks (say, grizzles) for the outside and slabs for the inside part of the cavity walls.

J. E.

[Reply].

Breeze blocks would be quite suitable for the walling of a bungalow, but we think our correspondent would be well advised to use breeze for the inside leaf only and a good ballast concrete for the outside leaf—the cost would be but little more, and would be amply justified by the better results, and a stronger structure, and, what is more important, one that will be absolutely weatherproof. In themselves breeze slabs are very absorbent, and would require several applications of rendering to make them weatherproof; it would probably be cheaper to use a ballast concrete for the outside slabs and dispense with the rendering. We do not recommend breeze slabs for chimneys. A good breeze concrete is obtained from a mixture of six parts graded breeze to one part Portland cement, and a useful size for the slabs would be 18 in. by 9 in. by 4 in. thick if breeze concrete is to be used for both leaves with a 2 in. cavity.

C. H.

Machinery Depreciation.

Sir,—I should be glad to know if any of your readers could introduce me to a book giving actual facts and figures regarding depreciation of builders' plant and machinery, including woodworking machinery, mortar-mixer, concrete-crusher, scaffolding and sundry tools. I have Matheson's "Depreciation of Factories," published by Spon, but it does not seem to give clearly the points which I am investigating.

"Builder."

Bristol Cathedral Renovation.

The Dean and Chapter have made an appeal for further subscriptions towards the cost of the work of renovation now in progress at Bristol Cathedral. The work, which is nearing completion, consists of new vestries, library, heating apparatus, and certain restoration; this is the first part of the full scheme, which also includes restoration of pinnacles of nave, the Chapter House roof, releading windows of the choir, the provision of a new oak lobby at the north porch, and completion of electric lighting. The total cost of the whole scheme was estimated at about £20,000; of this amount some £13,400 has been raised, leaving between £6,000 and £7,000 to be found to pay for the work nearing completion, and to allow of the second part of the scheme to be proceeded with.

STAINED GLASS

The first number of the *Journal of the British Society of Master Glass-Painters* contains an interesting account of the fragment of ancient fourteenth century glass which had been bricked up in a window in Chelsea Old Church for some three hundred years or more, of which a good illustration in colour appears as a frontispiece. Whether the Society can effect the results it aims at of educating the public in the matter of stained glass may be doubtful, and its belief that "having behind them the whole body of the members of the Society—such a body of expe t and authoritative opinion on the subject as has never been got together before—will go far to remove the ignorance which unfortunately still exists on the subject," may seem, to those who know, something of an over statement For really the matter is more difficult than this. Are these results to be reached by experts, or is it the old fallacy that by uniting into a body all those who separately have been unable to achieve this result, a miracle will happen? Interests may be developed and archæology may be furthered, but there is no stranger belief than this one so paramount in recent years that what has failed to be done by conviction and belief can be achieved through organisation. And it is just this complacency that raises at once a doubt in the mind of any one who looks deep enough into the nature of art—whether that of stained glass or any other—to know where improvement lies.

Mr. Noel Heaton's contribution to the pages on mediæval materials is well informed and instructive. When there are so many forgeries and "faked" examples of ancient glass, it is interesting to read that "The forger can reproduce every detail of the design and colouring of ancient glass so faithfully as to deceive any one, but he cannot reproduce the materials and conditions of working on mediæval lines so as to hoodwink those who can understand the evidence afforded by the glass itself of the conditions under which it was produced."

We must accept Mr. Heaton's statement that thirteenth century glass was of better manufacture than that of succeedlng periods, but even if the thirteenth century glass is better, we have no doubt that the artistry of the fourteenth century was of a far more beautifully developed character. The mosaic period of glass is a primitive and rather elementary one, and the value of much of this early glass is greatly over-rated. We should like to learn more of Mr. Heaton's views on the subject of firing. It appears to us in the case of staining the results obtained through gas firing do not equal those to be obtained through the slower method of the coke kiln. Is the action of the more rapid firing to be obtained through the gas kiln able to ensure results as good as those of the coke kiln? The subject is an interesting and important one, and we hope that Mr. Heaton will give us the scientific aspect of the matter at some future time in the pages of the Journal. Our own experience is that there is less richness and variety in the staining achieved through gas firing. Is there any ground for this belief? An article contributed by Mrs. Halahan on the association of flint chippings with fragments of old glass found in the mediæval glass houses at Chiddingfold, in Surrey, unfolds several very interesting particulars of our ancient method of cutting glass. The Journal contains many particulars full of interest to glass painters, and each number will include illustrated articles by specialists in every branch of the handicraft, this opening number containing the beginning of a translation of M. Olivier Merson's work, "Les Vitraux," which will be continued in serial form, the Council of the Society having been fortunate in acquiring the translation rignts of this most valuable book on the subject. The Society is to be congratulated on the first issue of its Journal, which should form a very valuable contribution to our knowledge of a most beautiful art.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

The Housing Bill.

The Housing (Financial Provisions) Bill received the Royal Assent by Commission on Thursday, August 7. The House of Commons had agreed with most of the amendments made by the House of Lords, but disagreed with four. The first was with regard to provisions for fixing rents, the second was the proposal to revise the scheme every two years, instead of every three, the third was to provide that draft Orders made under the Bill should be laid before both Houses instead of before the House of Commons only, and the fourth was the suggestion that those who rented the houses built under the Bill should be "members of the working classes." The Lords later agreed not to insist on these four amendments.

The Building Dispute.

Sir K. Wood asked the Minister of Health whether any local authorities had, in respect of their housing contracts, conceded the terms demanded by the building operatives in the present dispute; and what action he was taking in the matter?

Mr. Wheatley said that the terms of engagement of building trade operatives would primarily be a matter between the operatives and contractors concerned, and he had no knowledge whether, in connection with a contract for a local authority's housing scheme, the claims put forward by the operatives had been conceded. He proposed to take no steps favouring one side or the other in this dispute.

Sir K. Wood further asked what, if the demands of the building operatives were conceded, it was estimated would be the extra cost, respectively, of a parlour aud non-parlour house built under the State assisted housing schemes?

Mr. Wheatley said the demands of the operatives were not uniform throughout the country, but where the demand was for ½d. an hour, it was estimated that the average increase in cost of a workman's house entailed thereby would be about £4. As regarded the further demand for payment for lost time, sufficient information was not at present available to enable an estimate to be given.

The Weir Scheme.

Mr. D. G. Somerville asked the Minister of Health what steps, if any, were being taken by his department to test adequately the so-called Weir type of house construction?

Mr. Wheatley said he hoped that the method referred to would be fully dealt with in the course of the inquiry as to alternative methods of house construction just promised by the Government in the House of Lords.

Evictions by the Crown.

Sir K. Wood asked the Prime Minister whether he proposed to introduce legislation, or to give facilities for the same, with a view to further protecting tenants of the Crown against eviction proceedings and to ensure that on estates administered by departments there should be further facilities for the letting of houses?

Mr. MacDonald said he did not think that the circumstances were such as to call for further legislation. Tenants of the Crown had exactly the same legal protection as the tenants of any other landlord, and Government Departments acting as landlords gave the fullest and most sympathetic consideration to the conditions of each case.

Building Materials.

Sir F. Hall asked the Minister whether it was the intention of the Government to amend the Bill which had been introduced to deal with the question of the prices of building materials so as to enable the Government to take over building works without compensation in cases in which terms could not be agreed; and, if so, when an official announcement of the Government's policy on this matter would be made to the House?

Mr. Wheatley said the answer to the first part of the question was "No." As regarded the last part he hoped that it would be possible to take the Second Reading of the Building Materials (Charges and Supply) Bill early in the autumn Session.

Hadrian's Wall.

Major Church asked the First Commissioner of Works whether he would exercise his powers under the Ancient Monuments Acts of 1882, 1900, and 1910, as well as under the Consolidation and Amendment Act of 1913, so as to schedule Hadrian's Wall in order to ensure its preservation?

Mr. Jowett said that unless in cases of immediate urgency, his department awaited recommendations from the Ancient Monuments Boards before scheduling monuments. He was not aware that there was any need to depart from this practice in the case of any portions of the Roman Wall. The Ancient Monuments Board for England recently recommended for scheduling a few of the sections of the Wall which were still preserved, and they would no doubt deal with other sections in due course. The power of scheduling was confined to that given by the Act of 1913. The Act of 1913 repealed the earlier Acts. Scheduling only imposed on the owner an obligation to give the Office of Works notice before altering, adding to, or removing the scheduled monument. It gave no power to require the owner to keep it in repair.

Historic Buildings.

Major Church asked the First Commissioner whether he was aware that there were in England, Scotland and Wales a number of ancient monuments and historic buildings of large size and major importance which were falling rapidly into decay through neglect on the part of the owners; could he state whether the dangerous and decayed condition of such buildings was reported by officers of his department, and were representations made to the owners that repairs should be carried out?

Mr. Jowett said the Office of Works, through its inspectors and their local correspondents, did what it could to keep a watch on the condition of ancient monuments and historic buildings scheduled under the Act of 1913, and when cases of neglect were reported representations were made to owners as to the need for carrying out repairs.

Parliament rose on Thursday, August 7, to Tuesday, October 28, but will meet on September 30, if the Irish question makes it necessary to do so.

THE HOUSING BILL IN THE LORDS.

THE most striking feature of the debate on the second reading of the Housing Bill in the House of Lords, where nearly all the Lords who spoke were very sceptical of the practical results to be attained by the Housing Bill, was Lord Weir's suggestion that the only way effective production could be secured, in the absence of skilled labour, was by the standardisation of houses the main structure of which should be composed of a combination of timber and steel plate, with either metallic shingles or asbestos sheets for the roofs, which resulted at the Committee stage in Lord Middleton moving a resolution that having regard to the great charge upon public and municipal funds involved by this Bill, and to the deficiency of skilled labour, and the increasing cost of building materials, and to the consequent delay and enhanced cost in erecting the necessary houses an immediate inquiry should be set on foot by His Majesty's Government as to the possibility of building houses of other materials than brick, which could be erected more rapidly and at less cost. Lord Middleton said that on the second readin the Bill not a syllable was said to induce House to believe that 2,500,000 houses coul obtained in 15 years, or that the immec shortage would be in any way accelerate the passage of the Bill.

The Government accepted this mo through the Lord Chancellor, but this m probably accounted for an amendment w was subsequently carried, though not acce by the Government, that the period of rc should be in two years' time, 1926 inste 1927, as in clause 4.

The only reason for this can be that the H considering that the Bill as framed would result in the erection of the houses aime felt it should be restricted in time as an ex mental measure, and there is much to be for this, for it would be an awful thing to template 2,500,000 houses of a novel, if temporary nature, being planted all over country under the Bill before careful experi had been made and they had been thoro tested in every way.

We have always contended that this p of review, or of terminating contributions inconsistent with the scheme as put forwa the Government, for any agreement with building trade, or any continuity of policy, w it was asserted the Bill provided, was inc tent with these provisions in clause 4. nature, therefore, the Bill as drafted b Government was never anything more tha experimental measure, and it will make difference whether or not in the Commons amendment shortening the period to two is accepted or not.

The Bill never has conformed to the scheme propounded by the Government, a in its nature more experimental than its decessors, and it has become more and obvious in its passage through Parliament under existing conditions experimental it remain. If entirely new methods of cons tion are adopted and houses can be erect considerably lower cost, then the whole fi of the Bill will require amendment, but i case we hope that the country will not be s by the erection of houses which will en alter its character, and which may be rush in large numbers without their qualiti endurance and habitability as well as appearance having been carefully tested considered.

ASPHALTE ROADS

MR. J. GARDNER, in the House of Com recently, asked the Minister of to the fact that the Middlesex County C at its last meeting accepted the recomm tion of its Highways Committee authc the acceptance of a tender for surfacing asphalte at 8s. 5d. per yd. super; w he is aware that the lowest tender was 7 per yd.; and whether, in view of the fac the managing director of the successfu was a member of the Middlesex Council and also of the Highways Comr and was present at both meetings, he withhold payment of his proportion of th of this work until he had made the investigations.

Mr. Gosling said his attention had nc viously been drawn to this tender, t had caused inquiries to be made and w formed that the tender accepted by the M sex County Council was the lowest re for mastic asphalte, the material whic the county surveyor's advice, it was cons desirable should be used on the road in tion. He was advised that the price and accepted was reasonably comparabl prices generally current for this kind of In these circumstances there was no ju tion for withholding grants. In general ever, he had always held the opinion th members of committees adjudicating o tracts should not have any personal i in the decision.

OYAL SANITARY INSTITUTE ANNUAL CONGRESS—III.

REGIONAL SURVEYS.

OFESSOR PATRICK ABERCROMBIE gave an ss on "The Preliminary Survey of a n: Including the Built-up Areas and rban Centres, with Relation to the Public h."

said the argument was sometimes advanced there was no need to prepare a civic y—consisting of a collection of compara- iagrams illustrating the life of and illumi- g the history of a town—for those who were in it; they were, or should be, familiar its every aspect and problem; its survey l be contained within their heads where ain could review and compare without the rous machinery of maps. It was perhaps ecessary to combat this fallacy, but no ad yet suggested that a region, containing tizens of its many towns, the peasants of ntryside and its villagers, could be under- by an inhabitant of any portion of it, or ss by an outsider, without some study of its ic presentation.

h group—the town, the countryside, and illage—was prone to regard itself as a te unit for the purpose of planning and h, and the artificial boundaries of local rities tended to encourage this division of ion of interdependent communities into es of insulæ. And yet the farmer knew ie lived by supplying the town with milk iry produce and the townsman relied upon the country for his recreation, and in a ed ways each relied upon the other for its xistence.

egional survey, then, was necessary to n the essential unity of an area which was ially split up for administrative purposes eparate local authorities. The occasion of ey would probably be the first time that of its problems were thought of regionally Population, for example, was generally ered as though in watertight compart- ; a national figure was, of course, fre- y mentioned, then next the population of eat cities. But it was important to think population and its distribution over some l geographical region such as a coalfield, n-milling district, or a great river estuary; ain, the violent contrast that frequently ed between a dense town and its sparse yside.

aps the one aspect which had been gener- cepted as requiring regional study was that ffic. It was manifestly absurd to cease crutiny of a stream of motors the moment rossed the municipal boundary-line. This nd dynamic quality of traffic had been useful in directing attention along its quite irrespective of the ownership of the y through which it flowed. The same netration of town and country was in ce, though less evident, in every other

ngland, regional survey had been carried h independently and as the first stage in eparation of a regional plan of develop- When the survey had been undertaken ely it had generally been outside the hands of a local authority.

a review of surveys which have been out, or are now in course of preparation, urer said in any survey natural physical s should be first dealt with. Geological on was frequently a prime determinant of growth, whether it be the economic (such as coal) of certain strata or the od of subsidence following upon coal g. In the Wirral Peninsula it was found ie older villages, with wise foresight, ced themselves upon the dry sandstone s, leaving the cold, damp clay areas upon. Modern developments were to ignore such fundamental considera- In addition to normal underground and geology, there was the important study of different types of soil, affecting agriculture, afforestation, and market gardening. Wind and rain might be thought to be constant factors for individual towns, only requiring determining once for the districts. But regional study showed remarkable variations, amounting to practically different climates, and thus vitally affected development. The importance of the maps showing contours and levels need hardly be emphasised, and in close relation was the study of watercourses, rivers, marshes, and low-lying lands generally. At an early stage of the survey it was frequently possible to determine what lands were unsuitable for building purposes, whether unhealthy for houses, or too steep and irregular for general building.

There was next the study of vegetation, both natural and agricultural, closely related to the soil map.

The historical growth of the region could sometimes be conveniently examined by itself, though usually the historical element would be introduced into the study of each aspect. But the actual area covered by the more urban parts at different periods and the gradual concentration (and at times shifting) of the population might be usefully shown in separate diagrams.

Commerce, business and industry formed one of the most important subjects for preliminary study, and it would usually be found that there was less data available in the offices of the city authorities for this than for any other aspect. It would probably be found necessary, for purposes of mapping, to group industries of a similar nature together. There might be two main divisions of "heavy" and "light" industries, and these again might be divided into different groups. There were, for example, the miscellaneous industries found in every large town, such as gasworks, brickworks, &c., and there were the specialised trades. Nor was it sufficient to show merely the area occupied by the works; this measure alone was sometimes highly deceptive and should be corrected by a corresponding diagram showing the numbers of people employed in the different factories.

One of the most important lines of investigation would concern the tendencies discoverable towards centralisation or decentralisation.

Northwood Wesleyan Church.

MESSRS. WEIR, BURROWS & WEIR, FF.R.I.B.A., Architects.

Certain works, for example, must be situated in the centres of large populations, others were equally or better situated in the country. Again, the factors controlling the placing of industries were constantly changing, *e.g.*, until recently the Lancashire cotton factories were all placed on the rivers or canals, not for purposes of transport, but for the supply of water; this was no longer necessary. It should be the function of a regional survey to examine all these conditions; commercial inertia was a very frequent retarder of town and regional improvement.

The industrial survey must also be clearly read with the transportation and labour or housing survey. Population and housing might be conveniently grouped together, as it was customary to regard the position of the population when it was at home rather than when at work or at play. The population survey would be concerned with showing existing densities, in order that, seen in conjunction with the unbuilt-on lands, a scheme of regrouping following the lines of industrial development might be attempted. If, for example, the region contained one dominating urban centre, it would have to be determined whether the overcrowding should be eliminated either by a general spreading out of the central town, or by the creation of satellite communities cut off from the parent by intervening farm belts. Though the tendencies of this regrouping would be largely directed by industrial leading, it would be no less influenced by the conditions displayed in the physical survey. In some cases there might be indirect antagonism to apparently obvious industrial needs, as, for example, where a coal pit had to be sunk, for engineering reasons, in the midst of a low-lying tract where the ground would be further let down by subsidence; in this case the colliery worker, except for a small community of pumpers, &c., must live in the nearest convenient centre which was available.

The chief object of the housing survey was to give a vivid picture of the condition of all residential property in the region. A period plan should be attempted, in which a lease of life was allotted to every house. By this means a programme of house building and replacement could be undertaken, divided up not only according to numbers of houses wanted, but the time within which they must be built. In studying the existing housing conditions, also, an attempt should be made to discover, if possible, the reasons which had governed their present position, which had usually shown a centripetal tendency in the past. With this should be equated the opposing centrifugal tendency of the present day under the influence of cheaper land, open spaces for playgrounds and allotments, and improved means of communication.

Health diagrams were very desirable, particularly from the propaganda point of view, and wherever possible attempts should be made to show the relation between conditions of environment and health. A useful comparison could be made between town and country dwellings in this respect. Conditions of environment might also include, besides density, such factors as the proportion of works to dwellings, or the prevalence of certain types of house (*e.g.*, the "back-to-back" house, which had no through ventilation).

In addition to general death rate, there were infant mortality and death from special diseases. For example, in one region containing much low-lying land where it was desired to prevent further house building, it was essential to show that the villages on these low areas suffered consistently from diphtheria more severely than the villages on higher ground. In this section of the regional survey it would be of value to attempt to fix certain standards for the health of communities. Could, for example, a number of people resident per acre be agreed upon beyond which health clearly deteriorated? And, if so, could that standard be made the basis of, not only future housing, but the clearance of existing centres of population?

Means of communication might be readily surveyed, and offered an attractive field for this work. The actual volume of wheeled traffic upon roads, for instance, might be regarded either as to its axle-load or its degree of obstructiveness. Then, again, it might be an average load (spread over some convenient long period), or a peak load (confined to some instant or short space of time) which it was necessary to emphasise.

His primary object was to demonstrate that (1) the study of public health must be undertaken concurrently with that of other aspects; (2) that it was no longer possible to confine studies of public health or other aspects to the convenient units of single authorities, more particularly in those parts of the country, such as Lancashire, where urban conditions interspersed with belts of country largely predominated.

Discussion.

MR. WILLIS (Chiswick) said regional planning should undoubtedly come before town planning. Two schemes near London (West Middlesex and the Thames Valley schemes) were now nearly complete, but in his opinion could usefully have been combined into one. There were, however, small differences between the local authorities concerned, which the Ministry of Health could not bring into line. He thought Liverpool was somewhat on the same lines as London in the matter of town planning, for Liverpool and the area on the other side of the river might be very well included as one problem. The leading part in all town or regional-planning schemes was the traffic. Open spaces were another matter which needed serious consideration. At present, the total amount of open space necessary was empirically given as 10 per cent., but unless that 10 per cent. were properly disposed it was not nearly enough; in some places it was found desirable to increase that percentage. Finance was one of the chief difficulties of all such schemes; they were finding money for the future, and it was difficult to know whether the local authorities could afford to spend more than was required for the actual present needs of the community. While he agreed that regional planning should come first, it seemed a little unfair to merge the smaller authorities with the larger, for many of the small areas were doing good work which might be allowed to continue, provided capable town-planners were employed on it; it was desirable that each of the smaller authorities should be allowed to determine its own general plan. On the question of the density, he did not think it should be laid down as a hard and fast rule that no more than twelve houses should be built to the acre. In the Chiswick scheme there was a provision that twenty houses could be built to the acre, the reason being that nearly 27 per cent. of the whole area was open space. It was absurd where there was a large amount of open space in a district, and where land was costing perhaps £1,000 per acre, to limit the number of houses to twelve to the acre.

MR. SEARLES-WOOD, in referring to the effect of geology on the population of a district, mentioned that a few years ago the valleys in the Surrey hills near London were built on but not the hillsides themselves, the reason being that no water was available; since water had been laid on, however, the hillsides were becoming more and more populated.

MR. BROWNRIDGE said industry and economics largely affected town and regional planning. For the purpose of industry, it was important that large populations should dwell on small areas, and that led to the consideration of satellite towns and the question of increasing the area of local authorities. It was found necessary to engage in regional planning, and authorities were up against the difficulty of having to extend their boundaries for that purpose. If they considered the question of extending the areas and making a regional area for planning as well as for government, the question of satellite towns could be properly handled. It was a fact that many of the difficulties of proper planning were brought about by the local authorities themselves, who did everything in their power to attract large industries in an area at the expense of adding to the housi difficulties.

MR. BRODIE said in town-planning matte there was much room for differences of opinic He had no great faith in the possibility of sm authorities being able to carry out large worl They had had experiences in that direction Liverpool, where small authorities outside t area of the city had prepared schemes f housing and the erection of residential proper but were unable to carry them out owing the cost of main roads. The backbone of to planning was the provision of adequate ma roads; if the main lines of communicati were laid down town planning became a ve simple matter. He disagreed with the limit tion of twelve houses to the acre, and he did n believe that in the neighbourhood of every lar town practical men would consent to it. did not believe it could be done satisfactori and he did not believe it ought to be done. parts of Liverpool, near the Mersey, with plen of open space, as many as fifty dwellings h been built to the acre, and there was not a me healthy and sanitary area in the city. In lar cities the cost of land was so high that t limitation of twelve houses to the acre w quite impossible. Also, it had to be remember that everybody who was used to city life d not want a garden, and many of them did n know what to do with them when they got the The question of open spaces was importa and he preferred that they should be in t form of long strips radiating from the cent of the town to the outskirts rather than in t form of parks dotted about the town. As th got nearer the outskirts, where land was cheap the strips could be wider, and there would be l distance for anyone to go to reach a playgrou than by the more usual method of having pa dotted about in different parts. The Liverpc Corporation was purchasing land with the obj of carrying out something on those lines. all matters relating to town planning it w very necessary to take a very broad view. had known Liverpool fifty years ago, when t ideas as to the development of the city we not by any means the same as they were to-da with the best intentions in the world the ide of town planners to-day would be entirely c of date fifty years hence. Twenty-five ye ago he thought 60 ft. was a reasonable wid for roads to meet requirements of the futu and he widened most of the roads in Liverpc to 60 ft. in order to provide room for a doul tramway track. It was certain, however, th with the increasing speed of traffic in the futu the present idea of what was the proper wid of a road would have to be reconsidered, a with that in view in all new roads in Liverpc he was leaving a track 150 ft. between t houses which could be added to the road necessary in the future.

MR. GARLICK (Hyde) said the time wou shortly come when the Government would ha to take a hand in the question of collaborati between one region and another, especially connection with arterial roads, which should considered in their relation to the country a whole. The provision of a belt of agricultu land around each town, as advocated Professor Adshead, would also have to considered in the near future. In Hyde th had used subscriptions for a war memorial the purchase of 200 acres of agricultural la for a permanent open space for the use of t population. There was a good deal to be sa for the provision of such a belt of open count as it would prevent continually growing tow close to one another from merging and becomi one large built-up area. In Hyde they h found great difficulty in regard to gardens housing schemes, some of which were mer unsightly patches of clay. On some garde suburb estates there was a scheme by wh each tenant paid a sum on deposit to a garc fund which was used by the trustees to ke the gardens in good order if the tenant failed do so himself, and it might be a good thing something on the same lines could be done local authorities' housing schemes.

THE BUILDING TRADE

E INSTITUTE OF BUILDERS AND EDUCATION

e recent annual Conference of the of Builders with the Teachers of in Great Britain* a paper on "The al Policy of the Institute" was read . H. Adamson, in which he said in ith such a problem it would be con- o consider it under three heads—Past, nd Future.

stitute in the past had no very definite r beyond the encouragement given to e early stages of their training (by the f prizes and medals at various technical it relied chiefly on the efforts of indi- mbers appointed to serve on the com- these schools, who had done much by peration with the teaching staffs to he training of lads destined for the

present time the Institute did not con- with the problem of general education, essarily formed the basis of a sound education, but it recognised that the ng into the industry to-day were better and had greater opportunities of ood than in the past. He thought it n the first place to the moral influence om the general home environment of ding the secondary schools; second, nd teaching received in these schools; to the splendid training in the technical here every encouragement was given te an interest in, and a love for, good ship.

n of the Institute was to give such to the teaching staff of the technical would lead to a more practical appreci- the industry's problems and their nd the Examining Board, in drawing labus of the examinations for Licen- Associates, had endeavoured to meet ese problems.

construction naturally took first he syllabus of the examinations for and Associates, and to that he ere could be no objection.

prise had been expressed that so much was placed on book-keeping, y, finance and costing, and it seemed o explain why builders should place portance on these subjects. It was uilders in the past troubled very little untancy and relied on rather rough- methods of arriving at what they s the cost of their jobs—in many cases rous results. The rough-and-ready ght serve fairly well for a small busi- ith a large and expanding business— ness conducted on sound lines should xpand—more scientific methods were man might have a sound knowledge construction, might be well versed in ence, thoroughly understand trade uilders' quantities, &c., and yet il in the management of his business lid not thoroughly understand book- countancy, and costing. The pro- king costs was one of the many night- e builder, for, owing to fierce com- l unwise tendering, contracts were aken at prices which did not allow percentage to cover working costs, t charges, and profit. Builders ew the approximate percentage on their working costs and establish- s, but how many troubled to work entage on their labour costs alone? were low the only satisfactory way profit was to increase turnover and reduce the percentage of establishment charges, but unfortunately, in the endeavour to increase turnover, prices were often cut to such an extent that the profit vanished.

Book-keeping and accountancy were as necessary for a business man as reading, writing and arithmetic, and the inclusion of this as one of the compulsory subjects in the examination should prove invaluable to the future builder, and, he hoped, check the sometimes reckless competition which had done so much harm to the industry.

Builders' quantities and trade subjects formed the third group in the examination for Licentiate members, and candidates at the recent examination had the choice of three trade subjects, viz., carpentry and joinery, brickwork, and plumbing

The five subjects under the fourth group were geometry, mensuration and trigonometry, steel and reinforced concrete construction, heating, lighting and ventilating, and building materials, any one of which could be selected by the candidates.

The future policy must be dependent upon movement in the educational world, and in the industry itself, and it was therefore only possible to anticipate the direction in which that policy was likely to develop, but he could say with certainty that its main purpose would be to secure an adequate flow of suitable and well-trained lads not only to the various crafts but to the administrative departments of the industry.

The Institute would continue to grant prizes and medals for competition to the various technical schools, to encourage good craftsmanship, and it might be necessary in the near future to organise, in co-operation with the technical teachers, a scheme of preliminary examinations still further to encourage this class of student. Builders throughout the country realised that the technical schools were turning out the right type of lad for apprenticeship, and were beginning to see that the good work of the schools would be thrown away unless they were prepared to apprentice these lads. There was room for them. They were short of skilled men, and would never improve the present chaotic condition of the industry unless both employers and employees worked together with goodwill to solve the apprenticeship question. It was true some of the lads, after completing their training at a technical school and failing the opportunity of apprenticeship, managed to get work as improvers, but the aim of the Institute, in the best interests of the industry, should be to get the lads apprenticed.

There were certain crafts which, after some preliminary training at the schools, were more easily taught under proper supervision on the building, and that again emphasised the importance of apprenticeship. Some special competition or examination in the various crafts might well be introduced to encourage friendly rivalry between the apprentices of the various employers, but he thought the Institute would first of all have to grant medals to those employers who took the largest proportionate number of apprentices and provided the best training. The practice of granting a bonus to apprentices, over and above the standard rates provided in the indentures, for special ability, good behaviour, attendance at evening classes, &c., was well worth consideration in any scheme of national apprenticeship. The whole question of an apprenticeship system which would link up with the system of technical education was at present under discussion by another body, and he need only say that the Institute would lend its assistance in framing a sound national system of apprenticeship.

In dealing with the future policy in its relation to those intending to take up administrative positions, he wished to draw attention to the great change that had come over the commercial world during the last ten years, and to remind them that many men with a university training were finding their way into administrative positions in most industries with beneficial results. They needed more of those men in the building industry, to broaden their outlook and add wisdom to their councils.

The recognition that the building industry, as much as its allied industries, needed highly trained leaders equipped in the latest developments of modern science, and that the future of this indispensable agent of civilisation depended upon the quality of its leaders, carried with it a responsibility to provide for the adequate training of the youth of the industry. As a first stage towards acceptance of this responsibility the Institute of Builders was of opinion that the University of Cambridge offered the greatest facilities and the best opportunity for the economical solution of the industry's higher education problem. Although the older Universities would prefer to diminish rather than to increase the number of their undergraduates, the authorities at Cambridge, recognising the neglect of the building industry's educational interests and the importance of their claim, were not only willing but eager that a Chair of Building Science and Art should be established there, and they would afford all the facilities within their power to develop a course of study designed to equip youth with the broad outlook and the knowledge of practical and theoretical principles of the science and art of building required from the modern master builder. The formation of courses of study in building science and art would not at present require the foundation and equipment of new schools and laboratories. There existed at Cambridge special schools, museums, and faculties dealing with exactly the subject-matter of the building industry. In the schools were the teachers and the apparatus that the scientific and practical building student required. The practical reputation of the University's schools (especially that of the engineering schools) was well-known and world-famous.

All that would be required to initiate the scheme would be the establishment of a Chair of Building Science and Art, so that the educational needs of the industry's university students might become the special care of a professor who would undertake the organisation of a school and the focusing and directing of the existing courses for the benefit of building students. The proposal for establishing a Chair of Building Science and Art had been under consideration for nearly two years; a preliminary appeal had already been issued, and it was hoped the response will justify a general appeal to builders throughout the country for the purpose of raising the sum of £25,000, the estimated cost of endowing the Chair at Cambridge.

There was undoubtedly room for closer co-operation between the architect and builder, and what more fruitful soil could be found for this better understanding than the close association which a university training would give future architects and builders, who probably for the first two years would pursue the same studies under various professors? They looked to the architectural profession for inspiration in the design of buildings, and it seemed natural that the inspiration for the establishment of a Chair of Building Science and Art should come through an architect; and he would like to state how much the Institute was indebted to Professor Beresford Pite for the invaluable help and encouragement he had given to the Committee appointed to deal with this important proposal.

The Institute had no intention of attempting to impose upon the universities or technical schools courses of study which were provided by general building practice. There was a clear

y Mr. R. J. Holliday on "The Absorption ted Youth in the Industry for Training Positions" was given in our issue for

line between instruction in principles and their practice, and the work of the educational world was more nearly concerned in a thorough grounding in principles than in their practical application. It was part of the policy of the Institute to ensure a closer co-operation between teaching and practice by every means in its power.

EXAMINATION RESULTS.

The following candidates passed the Institute of Builders' Licentiate Examination held on May 20 and 21 last :—

A. P. Belton, Shoreham.
E. Bonsall, Nottingham.
W. M. Colley, Cardiff.
C. I. V. Curtis, Dalston.
I. R. Edwards, Tredegar.
A. E. Gale, Wandsworth.
W. H. Harper, Cheltenham.
E. L. Howell, Birmingham.
G. M. Linzell, Surbiton.
B. E. Lucas, Thornton Heath.
A. C. Matkins, London.
J. Normington, Treharris.
G. A. Robbins, Peckham.
C. E. Robinson, Luddenden Foot.
A. R. Rowlands, Birmingham
F. Russon, Edgbaston.
W. H. Saunders, Hither Green.
S. T. Saunders, Wimbledon.
A. J. Taylor, Eastbourne.
F. J. Thomas, Cardiff.
C. Walker, Elland.
F. Ware, Horwich.
A. T. Westrope, Fulham.
F. C. Williams, Cardiff.
W. E. Winterson, Dulwich.

In its report the Examining Board states :—

"Generally, the degree of knowledge shown and the quality of the draughtsmanship were below the standard looked for. There was a disposition to rely too much upon text-book knowledge, and a failure to supplement this with observation and practical experience. In the construction papers there was a failure to indicate suitable as well as sound construction. In book-keeping and accountancy there was a lack of thoroughness in the answers which indicated a need for greater attention to this subject. In builders' quantities, academic quantities were not required, but a greater ability than was shown in producing a foundation for a close approximate estimate in the form of builders' quantities was hoped for. Familiarity with the standard of measurement seemed to be lacking."

DISPUTE OVER A BAND-SAW

In the Shoreditch County Court recently, before Judge Cluer, an application was made in an action by the Zeta Wood Flooring (1910), Co., Ltd., of Essex House, High-street, Stratford, which they had brought against Messrs. Guilliet, Sons & Co., of 2, Worship-street, E.C., engineers and metal merchants, to recover £100, being the equivalent in francs, at the then rate of exchange, 102, of £85, paid by the plaintiffs to the defendants for a vertical band-saw. They alleged that there was a verbal arrangement for the delivery of the band-saw in three weeks, or a reasonable time, and such reasonable time had expired, so they asked for their money back.

Mr. Rowland Thomas appeared as counsel for the plaintiffs, and Mr. Troath for the defendants.

The application to the Court, on behalf of the plaintiffs, was for leave to inspect the correspondence that had taken place between the defendants and their works in France.

The band-saw was to be made in France, and the defence was that they had tried to get it from France by correspondence, but had failed to. Mr. Thomas said he did not know what was in these letters, but he did not want to be taken by surprise, and the defendants were now claiming that they were privileged, which had forced him to apply to the Court for an order to inspect.

Judge Cluer said he considered the plaintiffs entitled to inspect the correspondence, and made an order in those terms.

At the resumed hearing of this case on August 7, Mr. Thomas said the defendants were going to contend that there was no delay in the delivery, but it was not tendered until July 5, when it was refused. Mr. Gregar, managing director of the plaintiffs, was passing defendants' showrooms on March 5, and inspected a left hand band-saw machine, and actually purchased it, subject to his right to change it to a right hand. He did change it to a right hand, and it was now contended that where they could have delivered the left hand on the spot, the right hand needed to be specially manufactured by the French makers. They had now had an opportunity of inspecting the correspondence, from which it would appear that when in June the defendants were promising delivery, they received a letter from the French manufacturers, saying they had lost the order, and asked for a copy, as they did not know what was required.

Mr. Gregar gave evidence in support of this, and said it was desired to have the right hand machine, as they wished to cut timber in a particular way. When he telephoned asking for the right hand, he was again promised delivery in a fortnight, but allowed them three weeks. He paid the £85 the next day. He now found that whereas early in June they were promising delivery in a week, they were not even in communication with the French manufacturers, and it was not until June 21 that defendants sent them an urgent telegram, and that was three days after the plaintiffs had officially cancelled their order. He had now heard that the machine was dispatched from France on July 1. They had circular saws in use, but they wanted this for straight cutting.

In cross-examination, he agreed that there was nothing as to the date of the delivery on the order, but they only told him they would have to get it from France, not that it would have to be made. In his opinion, even if it had to be made, it could have been done quickly enough from the patterns.

After further evidence Mr. Justice Cluer gave judgment for the plaintiff for £85 and costs.

THE BURDENS ON TRADE

Lord Midleton's speech in the House of Lords recently, on the burdens on trade, was very instructive. He began by pointing out that the trade of the country was still less than it was in 1913, whilst the population had increased by a million and a quarter; the unemployed numbered 1,100,000; the burden of taxation had increased from £3 11s. per head in 1914 to £15 18s. in 1923; and the general rating had increased by 120 per cent. in the same period. The expenditure to which the Government was committed on housing and old-age pensions, education extension, unemployment insurance, and workmen's compensation, &c., amounted to 130 million pounds, and industrial burdens had increased by 300 per cent. since 1913. These were some of the burdens on trade, and Lord Midleton pointed out that the only way in which they could be met was by increased productivity; but our working output of production was 16 per cent. less than it was in 1913, and there was a great demand for a reduction in hours of labour; but a reduction from 53 hours to 47 would be equal to the withdrawal of a million and a quarter workers, or an increase in the cost of production of 200 million pounds.

In the course of the debate Lord Emmott pointed out that our exports were only between 750 to 800 million pounds in value, whereas we ought to be exporting between 1,000 and 1,100 millions to attain the volume that we exported before the war. Lord Midleton also showed that some portion even of this export was carried on at a loss.

We are still intent on setting our home in order, regardless of the fact that the income to maintain that home and the standard of living is by no means assured; in other words, we are too parochial in our views. The above are the conditions we live in, but are we making the best of those conditions?

The unsheltered trades bear the full blast of competition, whilst the sheltered trades are like greenhouse plants, or at least enj protection of the "cool frame," and thi inequality of wages makes for industrial Unless foreign trade revives this steep g in wages must become accentuated, w result which we are acquainted with in tion with our weather charts that steep g create hurricanes. These hurricanes are sent merely local disturbances chiefly c to the protected trades, but they ar of unsettled conditions and must be dea Industrial peace is a necessity. Th spirit of work must be revived. Lord in the debate in the House of Lords upon this when, as reported, he said a great believer in the regulation of h labour, if it did not diminish production was fatal was not to work less hours, work less hard.

There can be no question that the is working less hard. This may still result of the reaction from the war, b it exists cannot be denied. Taking o trade, and quite apart from evidence before Industrial Courts, anyone in any building operation, who was also in a like operation before the war, can to observe that the day's work put in men is far less now than in former tim that the cost of building is seriously affe this apathy.

Has one result of our desirable, and i cases, necessary, remedial legislatio to make us look too much to the St too little to ourselves to attain what we

If this be the case, we have an objec of the true Communistic State in but a more gentle reminder of State tr provided by a Blue Book just pu dealing with the losses incurred by Gov trading during the war, losses that, like in fatigue, are still with us.

It is essential that the questions we a ing with in this short notice should sidered quite apart from the heat o politics, and our only object is to brin important points before our readers partial consideration.

HOUSING

This booklet* has been prepared v object of dispelling some of the public ig on the housing question. Unfortuna succeeds only in illuminating those w passages with which the public may familiar already, and it leaves the in questions still wrapped in a century's d When we speak of Georgian housing we think of how the Georgians found the terers, how much they paid their tile many marriages occurred yearly, and w the average rent in the home counties. all we care about is what kind of hou have handed on to us. This pamphle appointing because, in picking at th and the detail of purely ephemeral cc tions, it entirely misses the spirit of the movement, which is not only to grant bodily comforts, but to provide dwel for intelligent persons to live in. This be achieved if our buildings are an adc the beauty of our country instead of sores to which we are accustomed. I enough for them to be free from smells overcrowded if they continue to be ugl ignore the very elements of architectur cannot live on bread alone. This boc sided view of our most important social is what one would expect of the " hard-headed business man," but on have expected from women a practic pretation of the longer view that would itself with presenting our grandchildr something worth having. Statistics plasterers, rentals, sanitary convenien apprentices are all of great importanc is disastrous to allow them to occ whole of the stage.

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., F.R.San.Inst. (Barrister-at-Law).

XII.—SUPERVISION OF WORK.—PROVISIONAL AND PRIME COST ITEMS.

Delay in Commencing the Work.

The contractor must begin operations without delay, and carry the work to completion within the period fixed in the contract. If no date of completion is fixed, then he must finish within a reasonable time. There may be certain preliminary works to be done, as stipulated, by the employer himself; and he, on his side, must do these with due expedition; if he is guilty of unnecessary dilatoriness, the contractor may hold him liable for any loss he (the contractor) may sustain owing to such unreasonable delay. See Lawson *v.* Weldasey, L.B. (1882), 11 Q.B.D. 229.

Compliance with Instructions.

Again, the contractor must do the work according to instructions authorised by, or contained in, his contract. Otherwise, the employer may be able to prove that the work, when executed, is of little or no use to him for his purpose, and therefore not of the value of the agreed price.

Nature of Soil.

Unless there are specific guarantees, or definite representations, made by the employer or his agent, as to the nature of the soil, a contractor cannot put up, as a sufficient excuse for abandoning his contract, that he has subsequently discovered that the nature of the soil is such as to make it apparent that the cost will exceed his tender as accepted. It is his business to satisfy himself on this point at the outset. See Bottoms *v.* York Corp. (1892), Vol. II Hudson on Building Contracts 208.

Restrictive Covenants on Land.

Where a covenant is in existence that the approval of the original vendor must first be obtained to any proposed building or structure before erection on the land, and a purchaser of the land erects any building or structure without first obtaining such approval, he may be ordered to pay damages. See Kilby *v.* Haviland (1871), 24 L.T. (N.S.)

Approval Precedent to Payment.

Where the contract does not contain any stipulation that the work and materials shall be approved by any specified person, then these must be such as to satisfy any reasonably-minded person. And it would appear that there is no obligation on the part of the contractor to satisfy the employer or his architect in particular in these circumstances.

However, it is usually made a condition precedent to payment that either (1) the employer, (2) the employer with the architect, or (3) the architect shall certify his, or their, satisfaction.

In each case, the right of approval must be exercised reasonably, and not arbitrarily or capriciously, but in good faith and not for the purpose, merely, of defeating the contract.

Nevertheless, there may be an express stipulation that any specified approval shall be final; in which case, so long as it is not withheld for the purpose of fraud or to defeat the contract, it would appear to be a condition precedent to payment, however unreasonable and excessive the refusal may be.

Approval by Employer Alone.

Where the approval of the employer is stipulated, he must have free access and opportunity to inspect the work.

The approval cannot be unreasonably withheld. The legal maxim that "no man can be judge in his own cause" raises the presumption against any *implied* contract that the approval is a condition to payment—and the jury would decide if he were acting in a reasonable manner. In Andrews *v.* Belfield (1890), 2 C.B. (N.S.) 779, the plaintiff (a carriage builder) had contracted to build a carriage of a particular description, also to the approval of the defendant as to convenience and taste. It did not meet his convenience and taste and he rejected it. The Court upheld his action. This principle is applicable to building contracts. It is to be noted, also, that, since the building becomes affixed to the freehold, the employer has the benefit of it, whether he approves it or not.

Hence, a contractor needs to exercise great caution before entering on such a contract.

Approval by Employer and Architect.

When approval is to be by both employer and architect, each would appear to have the power to exercise the right independently. However, when such dual approval has been given, even if defects appear in the work subsequently, the employer cannot retract his approval and recover against the contractor, unless he can prove that his approval was obtained by fraud. In Bateman (Lord) *v.* Thompson (1875), Vol. II, Hudson on B.C. 36, the contract made the certificate of the architect binding upon the employer, in certain cases. In one such case, the employer and his architect had approved certain building materials, and it was held that no action against the builder could lie, in respect thereof, subsequently.

Approval by the Architect Alone.

However, as the employer is usually not an expert, it is customary to make the approval of the architect, or, in some cases, of another third person not a party to the contract, all that is necessary. If the conditions of the contract make it clear that the architect is to act independently and impartially between the parties to the contract, or that his decision shall be final, then his approval is a condition precedent to payment.

Such approval must be given, or withheld, without undue influence of either party, and is binding on both parties, unless such undue influence or collusion can be shown; and it must be clearly stated in an approved manner. In Morgan *v.* Birnie (1833), 9 Bingham 672, the contract under question stipulated the reasonable satisfaction of the defendant's architect; the latter merely checked the builder's (the plaintiff's) charges and forwarded the account to the defendant. It was held that this was not a certificate of satisfaction, and did not enable the builder to sue the employer; although the employer had not refused payment on the plea of the insufficiency of the architect's certificate. Tindall C. J. said: "It appears to me that the effect of a certificate would be altogether different, applying to the manner in which the work had been done, whilst the checking of the accounts applies only to the propriety of the charges."

Architects' Instructions: Bad materials or work, variations, etc.

The architect acts, in general and normally, in a dual capacity as:—

(1) Agent of the employer—watching his interests.

(2) Quasi-arbitrator—to see fair dealing between the parties, under the terms of the contract.

For example:

(*a*) He must check all work and materials to see they are of specified quality.

(*b*) He cannot vary items of work, or waive any condition of the contract at the request of either party, without the consent of the other party; only as the agent of the employer if he has abrogated his authority expressly. See Cooper *v.* Langdon (1841), 9 M. & W. 60.

(*c*) He cannot dismiss the contractor for refusal to follow out his instructions; this is the prerogative of the employer.

The written contract and plans and specification define the scope of the architect's authority during supervision of work, and in relation thereto; and any tendency on his part to exceed his authority should be regarded with caution by the builder.

In general the architect is empowered:

(*a*) To inspect work; and, at his discretion, to have uncovered any work covered up without his inspection.

(*b*) To have any defective work or materials taken out and replaced by those of specified quality.

(*c*) To grant interim and final certificates for payment.

His powers should be discreetly and conscientiously exercised with a view to ensuring the contractor's compliance with the terms of the contract; and also with a view to his own responsibility in granting the final certificate of satisfaction.

Approval Written, Verbal or by Conduct.

Approval may be in writing, and must be written if such is stipulated in the contract; but it may also be verbal, or implied by conduct. It is left to the jury to decide whether there has been verbal approval or approval by conduct.

Provisional Amounts and Prime Cost Items.

It is difficult to draw an exact dividing line between "provisional amounts" and "prime cost items." Both are specified sums in the contract, which the contractor is to allow in his total, for work by special contractors or materials or articles from special merchants, or for goods of equal quality to those supplied by these contractors or merchants.

Under "provisional amounts" are generally included those for the work and articles supplied by sub-contractors, such as electric installation, or installation of a heating system; whilst under "prime cost" items are specified such small merchandise as locks, door fittings, etc., where "fixing only" by the general contractor is needed, and to be allowed for. "Prime cost" is understood as the net price charged by the merchant.

In both cases the contract usually requires the contractor to add and show what profit he requires, or his extra charge for "attendance on" the sub-contractor. And, if only a fractional part of the provisional sum is eventually used, the contractor is only entitled to the same fraction of his required profit which he had added. If, on the other hand, the sum provided is exceeded on the order of the employer, then the excess becomes an "extra" to be adjusted outside the contract. See Hobbs v. Turner (1902), 18 T.L.R. 235.

It is customary to allow a small profit to the contractor on the net prices of these items, even when he has not been requested to state the profit he requires.

Substitution of Sub-Contractors.

Where a specialist is named in the contract to be asked to provide any particular item, and the work is omitted or given to another specialist, the employer may be liable for loss of profit by the specialist and by the general contractor also—unless there is a clause such as "or other approved" inserted.

When no specialist is named, the architect may, at his discretion, invite the general contractor to contract for the item; in this case, however, the general contractor is not entitled to any extension of time in respect of the additional work.

Discount on Items.

When a "prime cost" is stated, it signifies the net amount payable to the merchant, and the employer is entitled to all trade discounts on items supplied.

The contractor's profit is first that which he is allowed thereon, or which he shows as added, and further he usually obtains 2½ per cent. discount by paying his account monthly to the merchant. If the contractor is also the merchant, he is entitled to all profits which another merchant would make on the same deal.

JOINT COUNCIL FOR THE BUILDING TRADE

MR. J. E. DROWER, C.B.E., F.S.I., writes: In last week's *Builder*, Mr. Stranks sets forth with a dazzling wealth of expression some wholesome truths. We know him as a convinced and extreme Socialist and yet he has found out, and has the courage to say that the abolition of what he would call the "capitalist system" cannot be done at a stroke, but must be done gradually. The revolution to which he looks forward cannot be sudden and catastrophic; it must come slowly and by consent. His words on the questions of apprenticeship and overtime are very welcome, as showing a desire on the part of a leader of trade unionism to discuss matters on which, up to now, the unions have been unyielding. And so he comes to the conclusion that the Joint Industrial Council of the Building Trade should be revived.

I confess that the last paragraph of Mr. Stranks' article is hard reading; it leaves me with the same feeling of giddiness as an attempt to read Einstein's theory of relativity. Yet in its coruscating phrases I seem to make it out dimly as a sort of peroration emphasising the need of a spirit of unselfishness and mutual forbearance.

If a body operated by such a spirit can be got together, nothing but good can come of it; the difficulty is how to get it together. As a member of the defunct Council I am convinced that to revive it with a representation and a constitution like the old, and in the hope that a new spirit would work in it, would be futile. Mr. Stranks is a strong man and a man of ability and energy; will he tackle the problem which he has set?

THE BUILDING TRADE DISPUTE

THE Conference, which we mentioned in our issue of last week, between the National Allied Building Trade Employers, including representatives of the Liverpool Employers' Association, representatives of the National Federation of Building Trade Operatives, and also representatives of the Liverpool operatives, was, after discussion, adjourned until the following day. At the adjourned conference, after a further discussion, a joint sub-committee was appointed to consider further the whole position. The joint sub-committee immediately began its work of investigation, and adjourned at half-past seven in the evening until eleven o'clock the following Tuesday.

Mr. Coppock, Secretary of the National Federation of Building Trade Operatives, in an interview to the Press, stated:—

"The Liverpool difficulty is not insurmountable, and the conference should immediately get over that question, and get down to the more fundamental questions affecting all building trade workers involved in the dispute."

On the question of the guaranteed week, or payment for lost time over which the operatives have no control, Mr. Coppock said:—

"We regard this as one of the greatest reforms in the industry for the last hundred years, and a reform that is necessary to attract the youth of the country to the industry, to make it worth while, and also to preclude any shortage of operatives in the future."

Representatives of the Liverpool building trade operatives decided that their delegates to Tuesday's London Conference should not be empowered to take part in the national negotiations. It is officially stated that the men are as determined as ever to fight for local agreements and a settlement of the local dispute without the interference of the national organisations.

The joint sub-committee appointed met on Tuesday at the Ministry, and after a day of apparently fruitless discussion adjourned until the following day. The Liverpool employers and operatives remained on at the Ministry to continue their deliberations, and the result of their sitting was reported to the joint sub-committee on Wednesday, but at the time of going to press no decision had been announced.

RATES OF WAGES IN THE BUILDING TRAD

The following are the rates of wages in the building trade in England and Wales. E endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur

	Masons.	Brick-layers.	C'p'ters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers.

ckley. A special Sub-Committee
nsider the scheme of proposed exten-
ie Sanatorium, for the Public Health
o sketch plan of proposed public con-
st Point, approved, and also proposed
nces in the basement of the West
approved. The E.C. intimated their
ake over on certain terms an area of
ckley Estate for a school. The Art
ee were requested to take the necessary
ompetitive plans for the erection of an
on the Infirmary old site.

e Governors of Baines Charity have
plans for the erection of a new school
500 scholars. The plans have been
. Halstead Best, of Blackpool, and
been given by the Governors for the
eeded with.

E.—The County E.C. is to erect
ws: Chepstow (£4,800), Rhymney
lo (£3,700), Pontllanfraith (£7,000),
9), Cwmcarn (£10,000), Markham
. Blaenavon (£4,000), Pontypool
stown (£2,050), Cwmbrau Central (£15,000), Argold (£6,000), four mining schools (£18,400) agricultural institute, Usk (£20,000), cookery centre at Tredegar (£2,500). In addition the E.C. has forwarded to the B.E. plans of new school proposed to be erected at the Trauch, Pontypool, for final sanction to proceed. The committee is also considering the erection of a new school at Cwmffrwdoer.

MORETON.—Arrangements are being made for the erection of a church at Hoylake. A site has been secured near the Cottage Hospital.

MYNYDDISLWYN.—The U.D.C. has approved the scheme of the Industrial Housing Committee to erect 180 houses at Tylagwyn, between Ynysddu and Pontllanfraith. The architect is Mr. A. F. Webb.—The Pontllanfraith local Welfare Committee (secretary, Mr. S. Bater), has a scheme in preparation for lay-out of grounds and erection of houses.

NELSON.—Preliminary parleys in respect to the new secondary school are still in progress between the local E.C. and the county authorities. Sketch plans of the building have been prepared and considered at a joint meeting of the representatives of both authorities, and following this the committee have decided to make a request for the building to be of two stories instead of three, as shown on the plans. They also favour the erection of a caretaker's house on the site, in order to ensure proper supervision and protection of the property, and the County Committee have been asked to consider the amended proposals. The new school will occupy a prominent site off Walton-lane, near to the Nelson and Colne boundary. Revised plans of the proposed new St. George's R.C. school rendered necessary by the decision to erect a church above the school, but excepting the roof this does not effect the plans of the school already approved by this Committee. The B.E. will raise no objection to this alteration, but require the revised plans to be submitted for this Committee's approval.

NEWCASTLE.—The Corporation Town Improvement Committee has adopted plans for the erection of 30 self-contained houses.—The City Licensing Justices have approved plans on the application of Mr. E. Gibson, for extensions at the "Crown" Hotel, Clayton-street, Newcastle. It is proposed to make a dining hall large enough to accommodate 250 persons.

NEWCASTLE-ON-TYNE.—The contract for rebuilding the premises of Messrs. Hindhaugh, Cloth Market, has been let to Mr. H. Waller, Newcastle. Large new buildings are to be erected and the archway from the Cloth Market to the new premises at the rear is to be considerably widened. The architect for the work is Mr. M. K. Glass, Saville-row, Newcastle.

NEWHAVEN.—House, Meeching-avenue, for the Rev. W. J. J. Cornelius.

NITSHILL.—The District Committee of Upper Renfrewshire has decided to proceed with the construction of drainage works. The estimated cost is £6,612.

NORBRECK.—A lay-out plan of the Norbreck Garden City Estate, prepared by Mr. Halstead Best, of Blackpool, provides for the erection of 500 houses.

NORTHAMPTON.—Plans passed by T.C.: House, Thursby-road, for Mr. S. Smith; house, Clarence-avenue, for Mr. F. Noon; conversion of factory into two premises, Roe-road factory, for Messrs. Wallis & Linnell, Ltd.; house, The Drive, for Mr. J. Jackson; house and carpenter's shop, Clarence-avenue, for Mr. H. Holloway; house, Crescent-road, Far Cotton, for Mr. L. C. Lovell; two houses, Beech-avenue, for Messrs. J. H. Welch & Co.; seven houses, Kingsthorpe-grove and Stanhope-road, for Messrs. A. L. & H. W. Chown; lavatories and cloak rooms, 6, The Parade, for the Royal Insurance Co., Ltd.—The T.C. have approved as winter work for the unemployed a scheme of road making on the Abington Estate, and also the construction of storm sewers, at an estimated cost of £15,000.—The Unemployment Grants Committee have approved of road construction schemes, and application is being made to the M.T. for sanction to raise a loan of £73,134 3s., the estimated cost of the schemes.

NORTHFLEET.—Plans passed by U.D.C.: Nine houses Burch-road, for Mr. H. W. Martin.

NORTHUMBERLAND.—Nineteen new schools, involving an expenditure estimated at £147,000, are required to bring the Northumberland B.E. Committee into line with the B.E.'s new policy of reducing the size of classes. To meet the requirements new schools will be necessary at Ashington, Hirst North, Hirst South, Hirst East, Bedlington Station, Bedlington Village, Stakeford, Choppington Guide Post, Nedderton, Cramlington, Shiremoor, Gosforth, South Gosforth, Forest Hall, Holystone, Newbiggin (West) East Denton, Newburn, Walbottle and Eltringham. It is suggested that the committee should consider the advisability of coping with this large programme over a period of five years.

NOTTS.—The annexe of the Shire Hall is to be converted into county offices, at a cost of £2,200, whilst it is proposed to adapt the servant's hall into a muniment room, the County Architect having declared it reasonably protected from exterior fire. It is built on brick arches and ceiled with steel girders, upon which rest concrete slabs. A load of £6,000 has been sanctioned for buildings at the Ransom Sanatorium. The Board of Control has asked the C.C. to provide accommodation for 400 or 500 mental defectives.

OLDHAM.—Funds are being raised by the congregation of the Glodwick Baptist Church for the erection of a new Sunday school.—A Committee of the T.C. has visited King's-road and instructed the assistant Borough Engineer to prepare bridge schemes. Bridge schemes are proposed at Goddard-street and Honeywell-lane.—The Borough Engineer has been instructed to prepare a scheme for levelling and draining the Salisbury-road market ground.—The extension and re-arrangement is proposed of the gas showroom.

OTLEY.—Relief schemes suggested by the U.D.C. include the widening of Otley Bridge, enlargement of swimming bath at Wharfmeadows, new footbridge from Sandbeds to East End, extension of water main in Farnley-lane widening of Pool-road and Weston-lane, and the continuation of Farnley-lane to the Ings.—Major F. H. Fawkes has given the Council additional woodland adjoining the Wharfmeadows Estate.—Plans passed: Two houses, Weston-lane, for Messrs. O'Brien & Richmond; house, Weston-lane, for Mr. W. L. Rhodes; house, Burras-lane, for Mr. E. Firth.

OSSETT.—The T.C. has now purchased a site from the Rowley Trustees for the erection of an elementary school at Gawthorpe.—A gas main is to be laid in Denby Dale-road, at a cost of £1,000.—Land is being purchased at Horbory-road, at a cost of £2,000, for a housing scheme.—Land is being purchased at a cost of £1,280, for playing fields, for the Grammar School.—Plans passed: Warehouse, Wakefield-road, for Mr. J. H. Nettleton.

OSWALDTWISTLE.—Plans passed by the D.C. House in Hawthorne-avenue, for Mr. A. Holgate; two bungalows in Sunny Bank-drive; and bungalow in New-lane. The D.C. have decided to acquire the Paddock Estate for housing purposes, and to borrow £2,613 for the construction of a new road across the estate.

OXFORD.—Plans passed by T.C.: Two houses, Bedlow-street, for Mr. D. Malling; house, Portland-road, for Mr. H. M. Argyle; house, Hamilton-road, for Mr. C. G. Eden; printing works, St. Aldate's-street, for Messrs. Fox, Jones & Co.; new wing to College building, for Governors of Lady Margaret Hall. A site in Cowley-road is suggested for the erection of a public convenience. It is recommended that a site in Broad-street be let to Mr. Arthur Pearson on condition that not less than £14,000 is spent on buildings.—To provide emergency accommodation for evicted tenants, the Housing Committee have prepared a scheme for the erection of 20 huts at a site in Gipsy-lane, at a cost of £3,600.

PADIHAM.—A proposal is under consideration to erect a bandstand with shelters in the Memorial Park, and to also place there a suitable memorial to the late Mr. Clayton, the donor of the park.

PARK PREWETT (HANTS.)—A house is to be erected at the county mental hospital for the assistant medical officer, at a cost of £2,000, and the plans have been passed.

PEMBROKESHIRE.—The Narberth Council will shortly invite tenders for the repair of the three arches, Norchard bridge, with alteration of the parapets.—The Haverfordwest R.D.C. has passed plans for a bungalow at Porthstinard, for Mr. Edwin Thomas, and a house at Llanychaer, for Mr. T. H. Phillips. A road improvement scheme is to be embarked upon by the Council, and grants have been applied for.—The Haverfordwest B.C. has decided to spend £3,000 upon repairs and extensions at the gas works and plant renewals. The work is to be put in hand at once.

PLYMOUTH.—The T.C. has accepted a tender at £79,874 for the erection of 134 houses at North Prospect.

PONTEFRACT.—Plans passed: Shop in Broad-lane, for Mr. W. J. Wilby; house in Halfpenny-lane, for Mr. W. Hodgson.

PRESTATYN.—It was announced that the Unemployments Grants Committee had promised grants towards the Dyserth and Meliden sewage disposal schemes, and the Waen water supply scheme, provided the M.H. sanctioned the necessary loans.

PRESTON.—The M.H. are to be asked to approve of the lay-out of the site of 50 new houses which it is proposed to erect between the arterial road, the Cemetery, and Miller-road. In order to give a better supply of water to Penwortham, the Water Committee recommend the laying of a 12 in. main from Jordan-street, along Fishergate Hill, to Penwortham Bridge, at an estimated cost of £1,550. The Lancashire C.E.C. decided the ask the C.C. for permission to raise a loan for £5,500 for the purpose of adapting and purchasing the St. Matthew's Free Church of England school for use as an engineering department and workshop for the Accrington Technical School. It was resolved, on the recommendation of the Architectural Sub-Committee, to seek power to borrow £700 to cover the cost of improvements in connection with the sanitary accommodation of Fleetwood Blakeston-street Council School. It was reported that the M.H. had sanctioned the raising of a loan for £7,700 to cover the cost of erecting a new school at Longton, the building itself to cost £6,881. The tender, £8,245, was accepted, and application was made and approved by the C.C. to raise the additional £1,364. The E.C. have resolved to utilise the Frenchwood school site for the erection of a central school, a junior elementary school, and a school for defective children. Competitive plans are to be invited for the lay-out of the site, and the erection of a junior elementary school.—The Water Committee recommend the laying of a new 12 in. main from Jordan-street to Penwortham Bridge, at an estimated cost of £1,550.—The Main Roads and Bridges Committee approved a scheme for widening a portion of the Preston, Lytham and St. Anne's main road, between Dock Bridge and the bridge across Liggard Brook, and for the reconstruction of the latter bridge. The total estimated cost of the work is £12,941.

RAWTENSTALL.—An enquiry has been held by the B.E. regarding a proposal of increasing the accommodation at Edyside School for the provision of 120 additional scholars.

REDCAR.—The T.C. has decided to erect another 50 houses.

RHOS (WREXHAM).—The North Wales Miners' Welfare Committee have made a grant of £8,000 to erect a Miners' Assembly Hall at Rhos. The scheme comprises an assembly hall to seat 1,000 persons, with a reading room, games room, baths, &c. The total estimated cost of the building is £15,000.

RHYDYPANDY.—A bridge is to be erected by the Tregaron District Council.

ROWLEY REGIS.—The erection of swimming baths, the paving of all footpaths, and the widening of numerous roads, at an estimated cost of nearly £60,000 are among the schemes adopted by the Rowley Regis (Staffs) Council.

RYE.—Plans passed by R.D.C.: Pair of cottages, Northam, for W. Tedham; bungalow, for Mr. Harvey.

SALISBURY (HANTS).—The P.C. has purchased land at Lock's Heath, for a burial ground, for £400, and is now laying it out at a cost of £100.

SCALBY.—Plans passed by U.D.C.: Bungalow for Mr. Beaumont, on Cross-lane; bungalow for Mrs. Rowe, on Burniston-road; bungalows for Mr. Firth and Mr. Boston, on Cross-lane.

SEDGEFIELD.—Plans passed by the R.D.C.: House at Chilton Buildings, for Mr. J. P. Coulson; bakery at The Broom, Ferryhill, for Mr. E. Callend.

SHEFFIELD.—Plans passed by T.C.: Bungalow, Cairns-road, for Mrs. E. Bolsover; two houses, Main-road, Handsworth, for Mr. G. Payling; 12 houses, Sandygate-road, for Messrs. T. W. Knowles & Son; four houses, Norton Lees-lane, for Messrs. Bonser Bros.; two houses, Norton Lees-lane, for Messrs. Bonser Bros.; two houses, Norton Lees-lane, for Messrs. Hammett & Co.; two houses, Richmond-road, for Mr. Thos. H. Ellis; four houses, Folds-crescent, for Mr. T. Leadbeater; two bungalows, School Green-lane, for Mr. L. Woodhead; house, Richmond-road, for Mr. J. Lee Hanstock; house, Cairns-road, for Mrs. E. Bolsover; four bungalows, Kennedy-road, for Messrs. S. Higton & Sons; house, Warmister-road, for Mr. A. Siddall; house, Prince of Wales-road, for Mr. Ernest Jennings; house, Shiregreen-lane, for Mr. Ernest Reeder; two houses, Richmond-road, for Messrs. E. J. Carey and W. Taylor; house, off Dalewood-road, for Mr. W. C. Davies; four houses, Abbey-lane, for Mr. J. Harold Stevens; bungalow and garage, Moorbrook-road, for Mr. H. Bartholomew; two houses, Toftwood-road, for Mr. F. Hessey; house, Bentley-road, for Mr. Margerison; two houses, Whirlowdale-road, for Mr. C. L. Marcroft; house, School Green-lane, for Mr. E. B. Ash; house, School Green-lane, for Mr. E. F. Cliff; house, Scott-road, for Mr. W. Harrod; house, saleshop and garage, Coleridge-road and Henson-street, for Mr. J. W. Jackson; six houses and garages, Bents-road, for Mr. J. H. Smith; bungalow, Abbey-lane, for Mr. E. Rosten; two houses and garages, Ecclesall-road South, for Messrs. J. Tofield and A. J. Belton; house, Leadstone and Havercroft roads, for Mr. Jno. Gibson; bungalow, Main-road, Handsworth, for Mr. L. C. Reading; bungalow, Main-road, Handsworth, for Mr. Ernest Williams; bungalow, Southey-lane, for Mr. A. Hathaway; bungalow, Cairns-road, for Mr. Frank Lane; house, Dalewood-avenue, for Mr. G. R. Parkin; two houses, Dalewood-avenue, for Mr. G. R. Parkin; four houses, Cairns-road, for Messrs. Spooner & Harrison; three houses (flats), Stoors Hall-road, for Mr. Charles Glossop; two houses, Carter Knowle-road, for Mr. Norman Booth; house, Severn-road, for Mr. J. E. Cooke; house, Cobnar-road and new road, for Messrs. S. Higton & Sons; four houses, garages and shops, Middlewood-road, and Langsett-avenue, for Mr. A. Womersley; house, Muskoka and Barnet-avenues, for Mr. G. M. Taylor; house, Whiteley-lane, for Mr. W. H. Bland; two houses, Dalewood-road, for Messrs. Gillam & Co.—The Corporation Markets Committee has generally approved data and explanatory statement by Mr. Hal Williams as to preliminary design in connection with the proposed abattoir scheme. A scheme will shortly be submitted by the Committee to the Corporation.—The City Architect has been asked to prepare plans for various works at the Intake Village Cemetery and the Woodhouse Cemetery.—A loan of £24,000 has been sanctioned for the widening of the Handsworth main road.—The Estates Committee has been asked to include in a future housing scheme 31 houses to replace a similar number to be demolished on the site to be cleared in connection with the proposed public hall.—The L.N.E.R. bridge which crosses the Retford-road at Woodhouse is to be widened at a cost of £23,000.—The M.H. has approved a scheme for the erection of a further 382 houses.

SOUTHPORT.—Plans passed by T.C.: Two houses, Haig-avenue, for Mr. H. Sutton.—New buildings for the electricity department are to be erected, at a cost of £1,150.—The B.S. has been authorised to continue negotiations for the acquisition of land at Ainsdale, on the Ince-Blundell Estate, for a recreation ground.—Plans have been passed for the lay-out of the Ainsdale Estate.—A site is to be secured for a new senior school.—The Electricity Committee has prepared a scheme for a new boiler house and equipment, to cost £35,000.

SOUTH SHIELDS.—The construction of the Coast-road from South Shields to Whitworth Colliery has commenced. An underground convenience is to be constructed at Imeary-street. The B.S. has prepared a design for a bowl house and aviary at North Park estimated to cost £730. Gipsies Green is to be laid out as a park, at a cost of £26,000. Plans passed: Messrs. T. A. Page & Son, for The Harton Colliery Miners' Lodge, per Jas. Stewart, secretary, proposed 4 self-contained houses, Harton-lane, adjoining the Workhouse; Messrs. T. A. Page & Sons, for Mr. Milton Swales, proposed self-contained house, North-avenue, Harton; Messrs. T. A. Page & Sons, for Mr. Alf. Ridley, proposed self-contained house, North-avenue, Harton.

STALYBRIDGE.—The T.C. has appointed the Mayor to represent the Corporation on the D.C. proposed to be established for the area of Lancashire and Cheshire in regard to town planning.—A site near Grey-street is being considered for the erection of a school.

STOCKTON.—The management committee of Stockton and Thornaby Hospital is to give consideration in the near future to the question of providing additional accommodation at the institution. A scheme under contemplation will entail an expenditure of approximatly £40,000.—Plans passed by the R.D.C.: Bungalow, Thorpe Thewles, for Mr. W. Howe; house at Wynyard-road, Wolviston, for Mr. Loughran, Port Clarence; house, Wolviston Green, for Mr. Dearlove; bungalow, Preston, for Mr. J. Wheatley; house, Preston, for Mr. F. Hay; house, Elton Back-lane, for Mr. W. Beswick, Stockton.—In order to provide accommodation for families who will be houseless by the clearance of the riverside slum area, the district valuer has been requested to negotiate with the owners of land at Mount Pleasant, Norton, for the purchase of 10 acres, on which it is proposed to erect 20 parlour type houses, 74 kitchen type, and 72 flats.

STOCKTON-ON-TEES.—Plans passed by T.C.: One hundred semi-detached houses on the Blue Hall Estate, Stockton Corporation; pair of semi-detached bungalows, Barnard-avenue, Mr. H. Lowry; pair of semi-detached houses, Barnard-avenue, Mr. J. F. Hornsby and Mrs. C. W. Piper.

STOKE-ON-TRENT.—Plans passed by T.C.: Lay-out of land at High-lane, Burslem, for Rev. J. R. Mee's trustees; lay-out of land at High-lane, for Mr. H. J. Steele; two houses off High-lane, for Messrs. Sharratt & Austin; house, Stone-road, for Mrs. Boden; two houses, Stone-road, for Mr. A. Bates; house, Stone-road, for Mr. L. Carblidge; two houses, Harpfield Estate, for Messrs. Dimbleby & Randalls; two houses, Oakhill Hall Estate, for Mr. William Ball; house, Stone-road, for Mr. E. V. Hammersley; house, Stone-road, for Mr. S. E. Watts; two houses, Harpfield Estate, for Mrs. E. G. Brown; school buildings, Oakhill School, for E.C.; four houses off Trentham-road, for Mr. W. Ball; two houses, Longfield-road, for Mr. T. Horwell; house, Victoria-road, for Mr. J. Foskett; house, Chell Green, for Mr. W. Collear; two houses, High-lane, for Mr. E. Kilgour; bungalow, Weston-road, for Mr. W. J. Blakeman; four houses, Market-square, for Messrs. J. Moss & Son; two houses, Milton-road, for Messrs. Shenton Bros.; house, Birches Head-road, for Mr. C. Brandrick; house, Rough Close, for Mr. W. H. Edwards. "The Foaming Quart" public house, High-street, Burslem, is to be rebuilt. A parish hall is to be erected at the corner of Mulberry-street and Wellington-street, Hanley. The B.S. has been asked to prepare plans for a bridge across the canal in connection with a new road at Hanley to the destructor works. The Sutton Trustees propose to build 160 houses on the Stoke Lodge site. A site at Hanley-road has been purchased by the T.C. at Hanley-road, for £2,672 for housing purposes.

STOKESLEY.—Plans passed by the R.D.C.: Six bungalows in Worsall-road, Yarm, for R. Seymour; three cottages and one shop at Great Ayton, for S. R. W. Moody; three cottages at Great Broughton, for W. H. Whitfield.

STRETHAM.—Revised estimates have been prepared by the county surveyor of the Isle of Ely for the erection of a bridge across the Old West River, showing costs of £3,000 for bridge and culvert, and £1,400 for approaches and roadway. The plans have been approved by the M.T. engineer and by the Ouse Drainage Board.

SUNDERLAND.—The Corporation Parks Committee has approved a scheme for the erection of a shelter, shops, and bathing bungalows on the low promenade at Roker, at a cost of £6,000.

SUTTON.—Plans passed by U.D.C.: House, Aultoneway, Garden Suburb, for Mr. H. T. Jackson; five houses, Lower-road, for Mr. W. J. Wyatt; two houses, Aultone-way, Garden Suburb, for Lovatt & Shaw; five houses, Greenhill, Garden Suburb, for Mr. C. A. Hudson, submitted by Mr. T. S. Town; pavilion for Sutton United Football Club; shop, with living rooms over, at the corner of London-road and Aultone-way, for Mr. H. Chessell; four cottages, Gander Green-lane, for Mr. F. Kennett.

SUTTON COLDFIELD.—Plans passed by T.C.: House, Belwell-lane, for Messrs. W. Hastilow & Sons; two pairs of houses, Beech-road, for Mrs. R. Hill; house Chester-road, for Mr. J. Whitehouse; house, Chester-road, for Mr. F. W. Harrison; house, Green-lanes, for Mr. Dineage; memorial church, Hollyfield-road, for rector and churchwardens; bungalaw, Hollyfield-road, for Mr. F. W. Falkener; house, Lindridge-road, for Mr. A. Showell; pair of houses, Penns-lane, for Mrs. Hall; house, Penns-lane, for Mr. W. E. Box; house, Penns-lane, for Mr. T. Grainger; house, Penns-lane, for Mr. C. J. Turrell; house, Penns-lane, for Mr. J. E. George; bungalow, Penns-lane, for Mr. B. G. Sheldon house, Somerville-road, for Mr. B. King; bungalow, Rectory-road, for Mr. H. W. Walker; house, Sherifoot-lane, for Mr. E. Goldsworth; two houses, Walsall-road, for Mr. F. R. Genders.

THAME.—Plans passed by U.D.C.: Two bungalows, Southern-road, for Messrs. W. Howland & Son.

THETFORD.—The Corporation has decided to construct a reinforced concrete wall to protect the south bank of the Little Ouse river from the Town Bridge to the Driftway.—The medical officer of health urges the need for a small pox hospital and a general infectious diseases hospital.

TORQUAY.—Land at Torcrest is to be laid out for development.—The T.C. has instructed the Harbour Engineer to proceed with the preparation of the detailed plans and drawings for forwarding to the Board of Trade and M.H. in connection with the application of the Corporation for sanction to the work and to the borrowing of the necessary money.—The B.S. has been authorised to proceed with the sea defence works, involving the construction of a length of concrete platform.—The B.S. is to prepare schemes for widening Newton-road. RENT RESTRICTION NOTICES: AMENDMENT ARREARS

A CASE which was reported in the *Times*, June 3, as "a test case," Williams *v.* Britannic Merthyr Steam Coal Company, Ltd., and Others, has illustrated some of the difficult questions arising in connection with recent Rent Restriction legislation.

It appears that in respect of a dwelling-house the standard rent of which was 7s. a week four notices of increased rent had been served, but only the last three are material to the decision, which were served respectively September 29, 1920; July 11, 1921, and August 6, 1922. No notice to quit had been given except in the last of these notices, none of which complied with the statutory form in several respects, but an application had been made under the Rent Act, 1923, which was passed July 31, 1923, to have the notices amended, and this application had been granted. Section 6, subsection (1) of that Act provides, "The County Court, if satisfied that any error or omission in a notice of intention to increase rent, whether served before or after the passing of this Act, is due to a *bona-fide* mistake on the part of the landlord, shall have power to amend such notice by correcting any errors and supplying any omissions therein which, if not corrected or supplied, would render the notice invalid, on such terms and conditions as respects arrears of rent or otherwise as appear to the court to be just and reasonable, and if the court so directs the notice as so amended shall have effect and be deemed to have had effect as a valid notice."

Section 1, subsection (1) of the Rent Restrictions (Notice of Increase) Act, 1923, provides that where notice of intention to increase rent has, "whether before or after the passing of this Act, been served on a tenant in conformity with subsection (2) of section 3 of the principal Act, and a notice to terminate the tenancy was necessary in order to make such increase effective, the notice of increase shall have effect and shall be deemed always to have had effect as if it were or had been also a notice to terminate the existing tenancy. . . ."

Before proceeding with the main question raised in the case it may simplify the points to make two observations. First, it has been held in Aston *v.* Smith (*Weekly Notes*, May 3) that under the above subsection of the Increases Act retrospective effect is given to notices of increase of rent as notices to quit; and secondly, it has been held in the case we are now considering that the powers of amendment conferred by section 6, subsection (1) of the Rent Act, 1923, extend to amending a notice of increase which was not accompanied by a notice to quit.

Having thus cleared the way by showing that the notices of increase operated retrospectively, and were made valid by the amendment, we come to the main point in the case, which was what was the effect of these notices? From the report in the *Weekly Notes* (June 21), published since this note was written, it appears the plaintiff was an employee and the rent had been deducted from his wages.

The County Court Judge had held that all payments already paid by way of rent under these notices as amended could be retained by the landlord, but that sums not so paid which would become payable by reason of the amendments could only be recovered in respect of a period of six months before the order to amend, by reason of section 8 subsection (1) of the Act of 1923, but the Divisional Court has reversed this judgment.

The point depends upon a number of provisions in the Acts.

By section 8, subsection (1) of the Act of July, 1923, it is provided "No increase of rent which becomes payable by reason of an amendment of a notice of increase made by order of the County Court under this Act shall be recoverable in respect of any rental period which ended more than six months before the date of the order."

Subsection (2) is as follows: "Any sum paid by a tenant or mortgagor which under subsection (1) of section 14 of the principal Act is recoverable by the tenant or mortgagor shall be recoverable at any time within six months from the date of payment but not afterwards, or in the case of a payment made before the passing of this Act at any time within six months from the pas Act but not afterwards."

This latter subsection was held to this case except as showing ability by the tenant was still tion 14, subsection (1).

The answer given by the C conundrum appears from the re been that, as by section 8, subsect a notice amended under section (1) rent was only recovera landlord in respect of a which ended within six months the rent paid in respect of the was irrecoverable by the landlo tion 1 of the principal Act, and coverable by the tenant under se section (1) of the principal Act

At present we find the decis cult to follow, and there woul sections of the Acts which are to in the case as at present which introduce time limits. tion (3) of section 8 provides in that section shall effect the o Notices Act, 1923, and the p tion 1, subsection (1) of the N introduces a time limit as follo in this Act shall entitle a land passing of this Act to recover in respect of any period befor 1922, the increase of rent made Act, or any sums which have from the landlord before that of deduction of rent or otherwi due before that date which has by reason of such deductions made therefrom, *but section 14 of the principal Act shall not crease of rent made valid by was paid or recovered from a December* 1, 1922."

We do not know whether t before the Court, but if the Not spective and the notices were sence of notice to quit, then an appear unnecessary, and even is made of that defect section Act, 1923, is not to affect the Notices Act. In this case, hov stand that all the notices w other respects and thus had to comply with the statutory the decision.

BUILDING TRADE WAGES IN SCO

THE following are the present rates of wages in the building trade in the pr Scotland. Every endeavour is made to ensure accuracy, but we cannot be resp that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	M
Aberdeen	1/7½	1/8½	1/7½	1/8	1/7½	1/7½	1/4½

NEW COMPANIES.

THE particulars quoted below have been compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, of 116 & 117, Chancery-lane, W.C.2, from the documents available at the Companies' Registry.

PEIRSON & Co., LTD. (196,807). Registered March 28. Structural engineers and contractors. Lincoln House, High Holborn, W.C. Nominal capital, £5,000.

SYDNEY A. HUNTER, LTD. (197,041). Registered April 5. 56, Buckingham Gate, S.W.1. Builders' merchants. Nominal capital, £10,000.

HOUGHTON & JONES, LTD. (197,036). Registered April 5. 24, North John-street, Liverpool. Builders and contractors. Nominal capital, £4,000.

E. J. RAWLINS & Co., LTD. (197,035). Registered April 5. 116, Burley-road, Leeds. Manufacturers of paint, colour and varnish. Nominal capital, £3,500.

GWENT BUILDING & CONSTRUCTION CO., LTD. (197,000). Registered April 4. 20, Lucas-street, Newport, Mon. Builders and contractors, &c. Nominal capital, £600.

CANNON, GREEN & Co., LTD. (196,852). Registered March 31. 16, Walton-street, Aylesbury, Bucks. Builders, builders' merchants, house decorators, undertakers and the like. Nominal capital, £5,000.

WINGATE, LTD. (196,910). Registered April 1. 76, Lemon-street, Truro, Cornwall. Builders and contractors, &c. Nominal capital, £3,000.

TILES (LONDON), LTD. (197,042). Registered April 5. 2–3, Duke-street, St. James', Piccadilly, S.W.1. Tiles, bricks, cement, lime and mortar manufacturers and dealers. Nominal capital, £100.

GEO. HYDE & SONS, LTD. (197,201). Registered April 11. Builders and decorators. Nominal capital, £3,500.

SCUNTHORPE SILICA BRICK CO., LTD. (197,239). Registered April 12. Brick and tile manufacturers, &c. Nominal capital, £10,000.

JOHN HUNT, LTD. (197,089). Registered April 7. Builders and contractors. Nominal capital, £5,000.

JOHN HEAP & SONS, LTD. (197,068). Registered April 7. Pioneer Saw Mills, St. Andrew's-road South, St. Annes-on-the-Sea. Joiners, builders and contractors. Nominal capital, £8,100.

TRAMONTINI, LTD. (197,077). Registered April 7. Builders' merchants, contractors, decorators, sanitary engineers, &c. Nominal capital, £6,000.

HARD & DICKERSON, LTD. (197,346). Registered April 16. 12, Brunswick-terrace, Cambridge. Building contractors, ironmongers, &c. Nominal capital, £2,000.

H. & C. THOMPSON BROS., LTD. (197,311). Registered April 15. Joiners and builders. Nominal capital, £2,000.

THOS. HYAM & SON, LTD. (197,303). Registered April 15. 6, Beauchamp-avenue, Leamington Spa. Builder and contractor. Nominal capital, £1,000.

ESTATES (ST. ANNES), LTD. (197,309). Registered April 15. 20, Wood-street, St. Annes-on-the-Sea. Builders and contractors. Nominal capital, £10,000.

TIMMIS & Co., LTD. (197,359). Registered April 16. Stamber Mill, Stourbridge, Worcester. Fire brick manufacturers, tile makers, &c. Nominal capital, £35,000.

CHARLES CRABTREE (BLACKPOOL), LTD. (197,254). Registered April 14. Carter-street, Blackpool. Plumbers, glaziers, builders, &c. Nominal capital, £2,000.

WOOD & SON (CROYDON), LTD. (197,517). Registered April 26. Builders and contractors. Nominal capital, £500.

THOMAS WARRINGTON & SONS, LTD. (197,427). Registered April 22. Builders and contractors. Nominal capital, £2,500.

CHAMPION PAINT CO., LTD. (197,412). Registered April 22. 37, Canning-street, Birkenhead. Paint manufacturers and merchants. Nominal capital, £1,500.

PATENTS

APPLICATIONS PUBLISHED.*

211,359.—N. Cockburn and J. Gilroy: Vertical bath tap.

196,625.—J. Kwachin: Adjustable desks for working, or flat writing tables.

211,378.—W. H. Parkes: Chimney and ventilating shafts and shaft tops.

211,387.—J. W. Guimont: Radiators for heating buildings.

211,399.—W. Williams, Jun.: Chimney, ventilator, and other cowls.

206,129.—Signal Ges: Machines for testing materials.

211,424.—G. H. Larsson: Interchangeable crushing-plates for crushing machines.

212,289.—L. G. J. Bratt: Kitchen ranges.

212,298.—M. Vogel-Jorgensen, E. Ronne and K. Middelboe: Process and apparatus for the utilisation of the combustion gases from rotary cement burning kilns.

212,301.—J. W. Kitchen, V. Lefebure and Powell Wood Process Syndicate, Ltd.: Impregnation of timber.

212,320.—F. R. Dickinson: Overflow and waste fittings of lavatory basins, sinks, and baths.

212,321.—D. Davidson: Reinforced-concrete structures.

212,327.—W. N. Haden, C. I. Haden and F. H. Horton: Apparatus for preventing waste of water in baths.

212,328.—Major & Co., Ltd., and W. Sangwin: Reinforced-concrete road foundations.

212,340.—N. M. Bell: Domestic fire-grate bottoms.

212,356.—R. H. Macartney: Domestic tables.

212,380.—C. E. P. Gabriel: Holding or retaining devices for sliding doors and windows.

212,406.—F. Morton: Paving blocks or treads.

212,419.—J. A. Eriksson: Method of manufacturing a porous material from Portland cement.

212,460.—J. T. Spence: Hinges.

212,470.—P. Junge: Deep-boring appliances.

212,474.—K. Walter and O. Henkel: Concrete linings for mining and like tunnels.

212,477.—F. Bodson: Construction of concrete and like structures.

211,899.—P. Pench: Machines for moulding concrete blocks.

211,926.—Paton, Calvert & Co., Ltd., and J. Hastings: Kerbs or fenders for fire-places.

211,928.—C. J. Copner: Chimney tops.

211,944.—J. Hodson: Manufacture of basic bricks.

211,947.—A. A. Thornton (Naamlooze Vennootschap Korrelbeton Maatschappij voor Woningbouw in Poreuze Beton): Walls, floors, and roofs of unrammed concrete.

211,948.—W. Hopkins: Mechanism for vibrating and consolidating concrete within moulds.

211,972.—C. N. Exley and H. A. Rimmer: Process for coating walls and paper.

211,973.—R. D. Johnson: Means for connecting pipes.

211,977.—W. Mycock: Boilers of hot-water installations.

211,987.—J. Howard, jun., and I. Downing: Manufacture of pipe fittings.

211,990.—J. E. Delbridge: Hinges.

212,025.—S. Timings: Wardrobes, showcases, shop window fittings.

212,056.—S. J. Kingsman, R. D. Kingsman and A. W. Bean: Fixing of shelves.

212,074.—J. Jones: Extension tables.

212,106.—Building Accessories & Flooring Co., Ltd., H. Goodwin and H. Smith: Manufacture of coloured asphalt.

212,116.—W. H. Tonks and W. Sparks: Stays or fasteners for casements.

212,142.—G. W. Bennett: Means for attaching glass plates to walls.

212,149.—Goddard, Walker & Brown, Ltd., and E. T. Beal: Device for showing a combination of colour schemes for house decoration.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

TRADE NEWS

THE first annual outing of the Tri Construction Co., Ltd., was held on J when the members of the staff journe Bognor by chars-a-bancs. In toasting the of the staff and employees of the Compa Managing Director, Major W. H. Smith, the stormy days of the first official ou the commencement of the company's w in that the Triangular Construction Co five years ago had ventured out when t clouds of very bad trade had burst thei and made it very difficult to struggle on was largely due to the united good spirit, and determination of all the employe success was now so rapidly approaching. Smith referred to the particularly good in the Triangular Construction Co., Ltd., staff, employees and management, poin the value of master and man working in unison, whereby everyone gave of h ensuring the maximum efficiency and r in a prosperous business. He then pro vote of thanks to the outing commit which Mr. Fernandes, as hon. sec., repl on behalf of all the employees expres thanks to the Board of Directors f assistance in making the day a success the Managing Director himself as be instigator of the proposition.

In the full-page advertisement of Archibald D. Dawnay & Sons, Ltd., works-road, Battersea, S.W.11, in week's issue, it was inadvertently state underline to the illustration that the ste for the building over Mansion House was designed by the firm. We are point out that this was an error, and designer was Dr. Oscar Faber, O.B.E M.Inst.C.E., engineer.

We have received from Messrs. Lumb a copy of their new 1924 catalogue. It many new designs, including their Dreadnought unbreakable" mild steel boilers and the "unbreakable" mild s patent boilers with corrugated fire b catalogue also includes the latest mode "Royal Beacon" boilers.

Messrs. William Shepherd & Sons, L now installed a second telephone line. Rochdale number, 912, is entirely the new numbers being Rochdale 702

A demonstration was given at Manc July 23 with a view to proving the e recently-discovered processes for bitumen stable and fire-resisting. By which is the outcome of three years o work by Mr. R. O. Child, the chemist D. Anderson & Son, Ltd., it was clai the new form of roofing, only one expensive as either slates or tiles, wo flames and heat of three or four degrees Fahrenheit. The experim place in the grounds of Messrs. premises. A brick building, about 2 in three sections, and stacked with w rated with petrol, was set on fire. section was roofed with bitumenised the other two with slates and tiles. informed: 'The felt roof was the only remained intact at the end of the conflagration. These tests prove tha so treated will not support combustic the purposes for which it is used is n mable. While ordinary bitumen will by heat and liquifies at 250 deg. F., a of covered cable will allow the copp sink from the centre, bitumen tre Anderson's process will remain stable atmospheric change. Painted with bitumen every five years, a bitume last a lifetime. It is a better insulato and cold, and better protection from and wet than a roof of tiles or slate D. Anderson & Son, Ltd., were supply felts to the British Government Crimean War.

In connection with the New Wa Wing of East Suffolk and Ipswich " Bennett's Patent Bed Grip and F System" was laid by Messrs. The "Z Flooring Co., Ltd.

TENDERS

tions for insertion under this heading should to "The Editor," and must reach him not Tuesday evening.
accepted. † *Denotes provisionally accepted.*

THE BUILDER

URNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

o. 4255. AUGUST 22, 1924.

SAINT PAUL'S BRIDGE AND LONDON

members of the Royal Commission of Fine Arts ave not had to wait long before their services were equisitioned in regard to a matter of first-rate mportance. They have been called upon to report ubject of Saint Paul's Bridge, but only as n (1) the engineering treatment of the bridge itself; ancial aspect as regards the Treasury; and (3) the f traffic. The report deals in no uncertain manner roject of the proposed bridge, and the Commission has e conclusion that it would be a grave risk to proceed present. There are still those who favour the building bridge on the grounds of traffic convenience, but on d very serious objection is raised by many who can ve expert advice. It seems hardly possible that Parlia- sanction the erection of the bridge in view of the formed by the Royal Commission of Fine Arts. nission objects to the method of approach from an ral point of view, but the main and serious objection ible risk to the safety of St. Paul's Cathedral. Whilst development of London has been delayed for years dequacy of bridge accommodation towards the west- ommission rightly emphasizes the objection to another ween Blackfriars and London Bridge within a range of undred yards, as only imperative traffic necessities ify it. Though this is styled a practical age, y likely anyone could be found willing to risk the such a monument of national value as St. Paul's, raffic or other considerations, and if it is felt to be isk to go behind the finding of the Royal Commission, nclude that, for the present at least, the doom of Bridge is sealed. We must not question too harshly aith of those who believe in its value, but the pro- t of the Commission surely leaves no option as to .

posing issues and opinions which a project like the Bridge has brought forth afford a graphic illustra- need for some better authoritative control over the t of London. It is not fair to assume, as so many o do, that fine projects and vivid imaginings neces- wasteful and even ruinous expenditure, for the and the generous thought are of the very essence of n we are thinking of the future well-being of a great not given to many amongst us to project thoughts ation beyond the pressing needs of the moment e which can only be forecast by some real under- the forces which are at work amongst us. We do great schemes of improvement for the sake of a can only be wise by scheming for many years we to assume that steam trains will always be ross the river and enter the city? Are we to allow years as the limit for the existence of fixed tram t we rule out for ever the possibility of London on le of the Thames becoming an integral and worthy at metropolis? Shall we ever impose some sort of limitation regarding the suitability of certain buildings to particular areas? Will some reasonable control be found possible over the hideous advertisements which disgrace our streets? Will traffic ever be compelled to take such routes between certain points that undue congestion may be avoided? Will the lumber and mess of market garden business ever be relegated to areas which will prevent its disturbing the amenities and traffic of city areas like Covent Garden? Is it possible that some day a great barrage may be formed across the Thames which would entirely alter the conditions which affect the river west of London Bridge? Will our great railway termini ever be altered in position or connected with an adequate scheme of zone railways? Will there ever be for London one authoritative supreme controlling body which may rise superior to local and parochial views? These are only a few of the questions which occur to anyone who has given thought to the future of London. The creation of more open space, the making of noble streets, the encouragement of fine exhibitions, and endless other matters, would keep a London Society busy for ever.

But we can never hope for that enlightened progress which is so essential until the citizens of London wake up to the possibilities and take some earnest action to make fine possibilities into fine realities. The official bodies who can do so much for London are, of course, the various borough councils; but they have behind them the London County Council, the City Corporation and the Government of the country. It appears to many that, in the making of an Imperial city, some definite Government help and control should be expected, but if it be not in the form of direct action or interference, it should surely be ever available to encourage in every possible way the enterprise and ambition of those who can do something towards the development of a great and beautiful city. We sincerely hope the existence and wise efforts of the Royal Commission of Fine Arts will be one of the vital forces making for a nobler and better London.

The problems which lie before us affecting the future of London are so numerous that we are apt to lose sight of their more immediate and relative importance. Probably that of traffic, with which is bound up the right control and development of railways, is about the most important and urgent. When we remember that every large new business establishment, every new house of entertainment, and every new hotel has a direct bearing on the traffic question, we may see how increasingly urgent is the need to provide for the wise direction and control of traffic if we are to cope with the incessant growth of the city. One has only to note the lower end of Regent-street to see how one large new hotel has added to the difficulties of traffic.

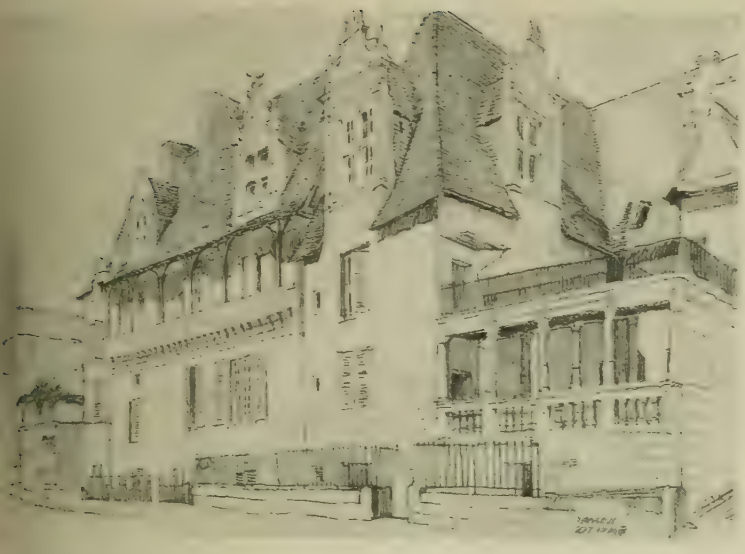
Practical problems are before us in quantity enough, and when we turn to things which affect the beauty and dignity of the city we can find more than enough to stir the hopes and imagination of all who have an artistic vision. To those who are apt to take a roseate and comfortable view of our high culture and fine artistic sensibilities, we need do no more than refer them to the north side of Piccadilly-circus.

NOTES

Manchester Art Gallery. A COMPETITION which will interest many of our best competing architects is that for the Manchester Art Gallery and Museum, the conditions of which are just announced. The building is to cost £300,000, and quite good premiums are to be awarded. In the assessing local skill is represented by Prof. Reilly and Mr. P. S. Worthington, in conjunction with Mr. Paul Waterhouse. We hope a better fate will attend this competition than the former one, and that a fine building will eventually rise to the credit of the architect and the city. One is inclined to wonder whether the imagination of designers will permit some of the more joyful and exhilarating qualities of architecture to be joined to the monumental aroma so greatly in evidence nowadays.

Building in America. IN a report on the finance, industry and commerce of the United States, just issued, Mr. J. Broderick, Commercial Counsellor at H.M. Embassy at Washington, states that both in volume and value of construction the year 1922 surpassed all previous records, but the activity which marked that year was largely exceeded in 1923, in spite of protracted curtailment owing to labour difficulties in the summer. By the end of 1923, we learn, the shortage of building due to the war was overtaken. In seeking for the reason for this remarkable activity in the United States one is inclined to think that they cannot be beset with the same difficulties as the building trade in this country, but elsewhere in the report one finds that this is far from the case. Taking 100 as representing the figure in 1913, the cost of materials in 1923 is put at 195, and the cost of labour at 210, which give average increases considerably more than those ruling in this country. Keen organisation and an extensive use of labour-saving devices are no doubt largely responsible for keeping down costs, but the fact that they have been able, notwithstanding high prices of materials and high wages, to carry on building at a figure which has attracted so many clients as to make the year a record one suggests that a thorough investigation of American methods would be of value to builders in this country.

Housing without Subsidies. IT is interesting to note from the same report that 45 per cent. of the value of the building work carried out last year in the United States was of a residential character. It is stated: "It seems almost impossible for further expansion [in building dwellings] to take place. Indeed, warnings are being issued at the present time by building organisations against the dangerously speculative character of much of the recent residential construction." Which shows that there are other methods by which houses can be built and sold or let at prices within the capacity of those who occupy them, besides the lavish distribution of subsidies and rent restriction. It might be worth while for the Government to send a deputation to find out how it is done.



Architectural Propaganda. THE possibilities of broadcasting as a means of propaganda are obvious. The listening public is rightly protected from the persuasions of the politician or the special ple religious partisans, but a welcome is given to speakers on of general interest, especially of scientific or topical character. opportunity this presents to a rea tive speaker on architecture as i everyday life! We can imagine more useful or stimulating than quarter of an hour spent in expl the suburbs of Britain what thos are like and what could be done them more tolerable. The ave with an aerial in his back garde bothered about architecture; p has considered it beyond his st what is more important, beyond Once get him interested and h an ally; he will begin to notice a We suggest a propaganda existing for the sole purpose architecture known.

Training in Landscape Design. IT is interesting to the subject of architecture has as a profession The handbook of the School of L Architecture, an official regist Harvard University, has just b and indicates the result of muc and effort since the year 19 instruction in landscape archit first offered and given at Har versity. The object of the study outlined in the pamp provide instruction in the el technical knowledge and t application of the principles which together form the prop professional practice, whether or public work.

Sketch in Bibury.

[Bibury is one of the most delightful of all the villages, even in the beautiful Cotswold district; one portion of it, lying on the higher level, is shown in our sketch.]

Sketch in Perigueux. By Mr. F. W. Knight, A.R.I.B.A.

cape tec- e.

This Harvard pamphlet has the following opening remarks: "Landscape architecture is primarily a fine ich aims to create and preserve in the efficient adaptation of land an service, whether in the planning of cities or in the develop- of preservation of the natural of the country. In its relation to ation of buildings and the treat- f their surroundings it requires a ity with certain parts of the l field of architecture; but its ls are mainly included within the geology, forestry, horticulture, il engineering, to which it is in much the same manner that ture is related to structural ing and other similar technical With the more and more wide- ealisation of our need for beauty as efficiency in land adapted to —beauty not merely as a luxury practical necessity and as much of course as practical efficiency— e a steadily growing demand for fessionally trained in the pro- of this beauty wherever land fitted to human service. This offers a large opportunity for nen as assistants in the offices of architects or city planning ons, as park superintendents, sters, &c., and as landscape in private practice or public During the period of our war y, the economic value of the architect's training in the adaptation of land for use was ted more clearly than ever residential developments for workers and in the laying-out y and naval camps and canton- nd our Government has officially the usefulness of the land- itect in such work. Now, the of landscape architecture in its cts has received an unpre- impetus, with a corresponding r trained practitioners."

Railway Posters.

The Great Western Railway Co., to whom we are already indebted on this account, are to be congratulated on the taste and attractiveness of the new poster "Malvern," now displayed in the stations. Pictorial advertisements of such a charming character add a further pleasure to travelling, and we could name other posters, such as the most delightful "The Open Road," and the quaint diagrammatic coloured maps which grace the Underground stations, which reveal the most attractive artistry and invention. We feel sure that the example set by such delightful work, which is so great a credit to railway advertising, will become in time more reflected in the work, so often tasteless and vulgar, at present displayed by private companies. The large advertisements in the "Tube" stations, other than those of the Company itself, are often far from attractive, as the traveller waiting on the platform for his train has reason to remember, and when it is remembered that the cost of production of the better class of advertisement need be no more than that of the more vulgar kind, it is seen that the matter is one of taste rather than cost. However, with the direction so much towards improvement we may hope the worst abuses of advertising will become a thing of the past.

Tomb- stones.

We have heard a great deal about art in everyday life, but the campaign has so far touched but lightly on the cemetery. The white marble tombstone of England might well stand symbolically as a monument over the grave of beauty itself. Tombstones are ordered out of trade catalogues, like seeds, and our ever-growing cemeteries are, as a rule, sheer disfigurements. Architects might well turn their attention to this branch of design. Every well-designed tombstone would attract some admirers and would act as a missionary to the reintroduction of good taste in our graveyards. Sentiment rebels against the system of showing respect for the dead by erecting a monstrosity according to its number in a catalogue, and many who would hesitate to ask architectural advice for a cottage would (if they thought of it) not at all grudge a small fee for an adequately-designed memorial.

Archbishop's Palace, Albi.
From a Sketch by Mr. F. W. Knight, A.R.I.B.A.

GENERAL NEWS

Westminster Bridge.

The London County Council has given notice that Westminster Bridge will be closed to all traffic for a period not exceeding fifteen minutes on the afternoon of Tuesday, August 26th, about 3 o'clock. An examination is now being conducted with a view to determining the effect of the present increased weight and speed of vehicular traffic, and is not due to any doubts of the stability of the bridge.

The Society of Architects.

An Extraordinary General Meeting of The Society of Architects was held recently at 28, Bedford-square, London, W.C.1. Mr. E. J. Partridge, President, having taken the chair, the minutes of the Extraordinary General Meeting of July 24 were confirmed and signed. The chairman stated that he had received 560 proxies of which 552 were in favour of the resolution. He then moved that the following resolution, passed at the Extraordinary General Meeting on July 24, 1924, be confirmed :—

"That this meeting hereby approves, ratifies, and confirms the Provisional Agreement for amalgamation, dated the 29th day of May, 1924, and made between the Royal Institute of British Architects on the one part, and the Society on the other part, and hereby directs the Council of the Society to carry such agreement into effect either with or without modification."

Mr. E. J. Williams having seconded the resolution, the chairman put it to the meeting, and declared it to be carried unanimously.

Welsh Hill Forts.

Interesting discoveries are reported to have been made as a result of further excavations in the ancient Hill Fort, known as Dinorben, situated in Kinmel Park, Abergele. The work has been carried out under the supervision of Mr. Willoughby Gardner, of Deganwy, and it is asserted that the probings into the secrets buried beneath the vast earthworks at Dinorben show :—

(1) There were dwellers upon this hilltop prior to its fortification, as proved by relics found.

(2) There were four consecutive hill forts built by the natives upon the hilltop, and each suffered forcible destruction at the hands of an enemy.

(3) The first hill fort was defended by a stone-faced rampart with a deep ditch cut in the rock some 10 ft. in front of it. Its destruction was shown by relics to be during the later Iron Age, and it was so complete that one can hardly doubt that it was the result of a Roman invasion of the district—very probably that under Ostorius from Chester about A.D. 60. The remarkable late Celtic bronze horse trappings found with quantities of human bones at the foot of the precipice at the west side of the hill fort would seem to synchronise with this.

(4) The native builders of the second hill fort constructed oblong guard-houses at the main entrance, which points to an acquired knowledge by this time of Roman methods.

(5) The second and third constructions at Dinorben, like the neighbouring hill fort at Peny-y-Cordynn, were apparently occupied for short periods only, as shown by the paucity of relics left behind.

(6) The second and third destructions occurred before peaceful trading relations between the natives and the Romans were established, and may have been the results respectively of the dash across North Wales by Suetonius in A.D. 60, and of the conquests of Vespasian's generals completed by Agricola about A.D. 70.

The excavation of this notable hill fort is pioneer work in Wales. It is hoped that this provisional chronology for the successive constructions found upon the site may be confirmed by future work.

COMPETITION NEWS

Manchester Art Gallery.

The conditions of the competition for architectural designs for the new art gallery and museum of art to be built on the Piccadilly site have now been issued by the Manchester Corporation. The building is not to cost more than £300,000 and is to be of Portland stone. It must be approached by a flight of steps and must include a Hall of Memory to commemorate Manchester men of all ranks and services who fell in the war. The jury of assessors consists of Mr. Paul Waterhouse, Professor C. H. Reilly, of Liverpool, and Mr. P. S. Worthington, who will award four prizes, the first of £500, the second of £300, the third of £200, and the fourth of £100. The building is to occupy an area not exceeding 5,500 sq. yds., and the total floor area required for the central sculptural hall is 6,000 sq. ft.

Club Premises.

The committee of the Rhyl Conservative Club invite schemes for adding a second story to the Club premises. Particulars from the Secretary, Market-street, Rhyl.

London Hotel.

Designs for a row of shops, with an hotel over. Premiums of £150 are offered for the selected designs. Particulars from Mr. H. Walduck, Imperial Hotel, Russell-square, W.C. 1.

The closing date of the competition has been extended until September 24th.

The conditions of this competition are not in accordance with the regulations of the R.I.B.A.

The Harrogate Infirmary.

The committee of Harrogate Infirmary invite designs for the extension of this Infirmary. Mr. Sydney D. Kitson, F.R.I.B.A., has been appointed assessor. Premiums of 150, 100, and 50 guineas will be awarded respectively. Sending-in day September 30.

Other Competitions

Other competitions still open include the following (the dates given are, first the sending in date, and second the issue of *The Builder* in which full particulars were given):— Ross-Smith Memorial (Sept. 30; Feb. 22). Hamilton War Memorial (Sept. 1; May 30). Glasgow High School Memorial (Sept. 30; June 13). Public Baths, Newton-in-Makerfield (Sept. 30; July 11). Bexhill Hall, banned by the R.I.B.A. (Sept. 1; May 30).

Detail of War Memorial Design.
MR. F. LESSORE, Sculptor. (*See p.* 275.)

ST. PAUL'S BRIDG

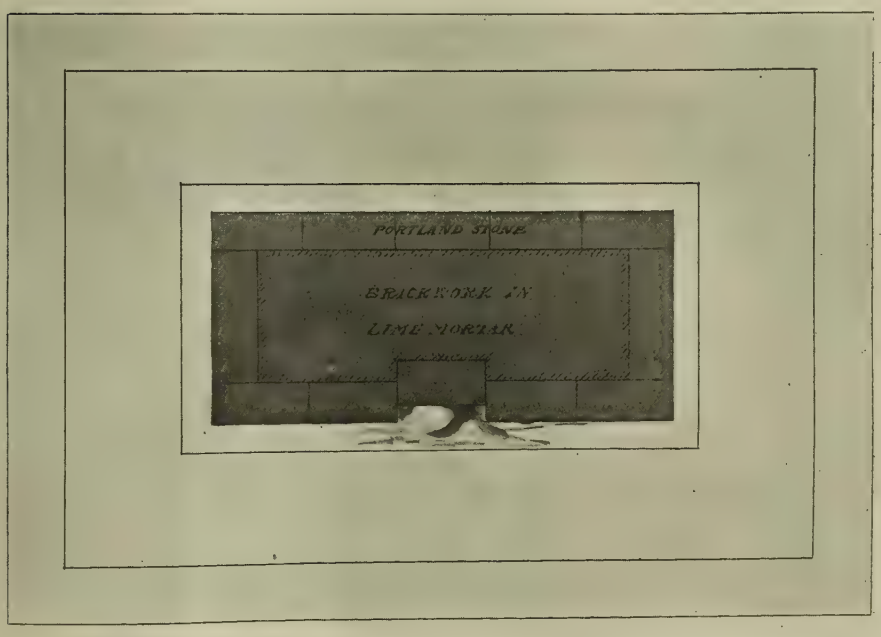
THE report of the Royal Fine Art mission appointed to inquire into the pro connected with the proposed St. Paul's was issued recently as a Parliamentary Towards the end of May the House of on the motion of Viscount Burnham, that the Commission should be consulted question of the proposed bridge before steps were taken. The Commissioners Earl of Crawford and Balcarres (chairma Marquis Curzon, Sir Aston Webb, P.R. Reginald Blomfield, R.A., Sir George Fra R.A., Sir Edwin Lutyens, R.A., Mr. Cameron, R.A., Mr. J. A. Gotch, Presid the Royal Institute of British Architect Mr. T. H. Mawson, President of the Planning Institute. In a footnote to the Lord Crawford states that, while it ha impossible to obtain Sir Aston Webb's ture owing to his illness, he concurred general principles enunciated by the mission.

The report is as follows :—

We must observe at the outset th terms of reference preclude us from with three crucial aspects of the su namely, the engineering treatment of the itself, finance which affects the Treasury extent of £866,000, and with traffic.

The safety of St. Paul's Cathedral is the most vital of many difficult p raised by the proposal. Were it not dominant question of stability, we shou recorded a considered opinion as to th of disappointment resulting from a bridg does not lead to the southern transep axial point. Owing to financial and objections, the Act of 1911 laid down t thoroughfare running northwards fr bridge should pass the eastern end Cathedral. The road will accordingl the apse of St. Paul's, giving a part oblique view as one passes in either di A sense of failure, or of a singular opp lost, will be inevitable.

On general grounds the scheme wo largely tested by its direction, levels, gr and terminal points. It will be far fr to deal with the bridge and its approa a monumental fashion, owing to the st from the river to Old Change. On th side of the river the road will have three streets, on the north side three m one subway will also be necessary. M a sixth bridge between Blackfriars and Bridge, within a range of 1,300 yard only be justified by overwhelming necessities.



We think it unnecessary to commen proposed design or to amplify analogo ments, since all considerations of acc struction, town-planning, and vista ordinate to the central and all-import to the Cathedral structure. The piers ing the Dome are in a precarious co serious fears have been entertained a safety of the Dome itself. The D Chapter have had to appeal for £17 carry out urgent works to maintain the and after several years' work upon t are satisfied that their obligations ar means attained.

Heavy motor traffic is increasing; a serious risk from the transmissio vibration through the London clay, effect of which is now confined to the side of the Cathedral. Until the secure any further risk should be avoi intensify existing dangers by adding source of vibration at the eastern er Paul's, with inevitable reactions u perilous thrust of the Dome on the pie crossing and upon the southern wall, such grave apprehension that we beg that immediate attention may be this serious aspect of the problem. shaking of the Cathedral fabric may catastrophe.

FRONT ELEVATION

PLAN

F. Lessore, Sculptor.

Design for a War Memorial. Mr. F. Lessore, Sculptor.

[This war memorial would be about 20 ft. in height, and carved in stone. It is intended to suggest a gate, the group in bas-relief representing an angel bearing aloft the soul of the fallen warrior, while a few of his discarded trappings are left behind to remind us of his fate.]

CORRESPONDENCE

Tudor House.

SIR,—The recent building of Messrs. Liberty's new premises, Tudor House, is a typical instance of that attempt to reconcile old tradition with modern outlook, and is, therefore, the subject of much difference of view. The original Tudor style arose out of conditions, out of a life, which was essentially different from our own, was more unconscious of itself as art than are modern stylistic imitations. Our revivals of past styles are intellectual rather than intuitional, and have none of the naiveté and unselfconsciousness which so much contribute to the charm of the older work. In this light the remark of Professor Lethaby in his letter contributed to the Architectural Conference, that "all the attempts to make modern highly organised building resemble the old free architecture are doomed to failure," is of much significance. And in this new costly experiment of Tudor House there is something intellectual and theatrical; handicraft here takes a rouge and powder quality as though to manufacture artificially what nature and art in such a context refuse to supply. Handicraft becomes a convention itself, remaining only the shadow of its freer reality. If we could only have it both ways, our modern restlessness and Tudor rest, the quiet undemonstrative character of the one with the publicity aims and advertising conventions of the other, Tudor House would hold in it that sacred rather than spectacular character which is found only where nature and the human soul move together. As Professor Lethaby says so truly, "Decoration is of the nature of poetry." It is the approach, the spiritual outlook, that matters. All the talk on handicraft only obstructs our vision of this need if we neglect the one for the other. I doubt if many are really deceived by this intellectually organised substitute for really free building. Art will never yield its riches, handicraft, however much belauded or paid for, will never yield its best results though we stick it all over a building, without the freedom of its own ideals, and there is probably more vital craftsmanship in one single panel of those on the west porch of Amiens Cathedral than is contained in the work on Tudor House. Nor is this any criticism; it can hardly be otherwise, because it lacks the freedom which only the spirit of poetry and worship bestows.

"ISIS."

Architects and Small Houses.

SIR,—When Mr. J. E. Drower stated, in the valuable letter you referred to in your last issue, that the employment of architects to design small houses is one of the causes that tend to increase their cost, he no doubt meant architects who had not made the special study of that class of building that is so highly necessary to produce suitable designs that can be executed at a reasonable cost. Architects who have made that special study carefully consider "the choice of material and method of building" that Mr. Drower refers to.

W. T. H. LEVERTON.

London.

Penistone War Memorial.

Penistone war memorial, which was unveiled recently, is in the form of a cross. It is the design of Mr. J. A. Gotch, P.R.I.B.A., executed by Mr. E. T. Moore, monumental sculptor, of Penistone, and is placed in front of the Parish Church tower facing the main approach to Penistone.

£800,000 Dry Dock.

It is reported from Kingstown (Ontario) that plans are under way for the building there of a new dry dock to cost approximately £800,000 and to quadruple existing facilities. The construction of the new dry dock, it is stated, will take at least three years. It will be 300 ft. wide and 700 ft. long.

BOOK REVIEW

Acoustics of Buildings. By F. R. WATSON. (London: Chapman & Hall. Price 15s. net.)

THERE is an urgent need to-day for a book which will make the assured results of scientific inquiry on this subject available for the architect and the builder. The broad outlines are to be found in the papers of that great pioneer, Wallace C. Sabine, but they are not to be found there in convenient form, nor in the nature of the case, and his original papers convey no idea of the steady process of verification which has gone on throughout the last twenty years as his formula has been applied in case after case to the cure of existing buildings and the design of new ones. The day is past when a great daily paper can afford to commend the stretching of wires across the roof of a building as a cure for acoustic defects, and this book will contribute to its passing. The book is divided into three parts, of which the first is an introduction on the action of sound with application to buildings. This is the weakest part of the book. A much fuller though still non-technical discussion of the properties of sound waves and the mechanism of their propagation would have laid a more adequate foundation for what follows, and contributed to a more intelligent appreciation of the problems involved. Readers without previous knowledge of sound will not find their difficulties materially lessened by the introduction. Part II deals with the acoustics of auditoriums, and although a little too condensed in its treatment it deals with the subject in a very practical and convincing way, and gives numerous examples of design and cure of actual buildings by way of illustration. Only in the multiplication of these actual instances is there any hope of carrying conviction of the soundness of the methods to the architect and the builder. From an investigation of the actual time of reverberation in satisfactory buildings of various sizes designed either for speech or for music, the author shows that the ideal time increases with the volume of the building. He gives curves in which the time of reverberation in seconds is plotted against the cube root of the volume, and from these curves we can valuable information as to the best time reverberation for a building of any given whether it is to be used for speech or for m The last part (Part III) of the book is dev to the important matter of sound insulat The author's own work on this subject is bodied in Chapter VIII, and the work of o investigators in Chapter IX. Here, agai discussion of numerous practical instan telephone boxes, music rooms, hospitals, adds greatly to the value of the work. book contains an admirable list of the efficients of absorption for common buil materials, and is copiously illustrated bold and clear diagrams. Mr. Watson collected, arranged and made available a deal of information, and his book will be comed by all who desire to know more subject long regarded as mysterious, but at last taking its place within the ever-wid area of the uniformity of nature.

OPES AND FEARS FOR ARCHITECTURE

By "ISIS."

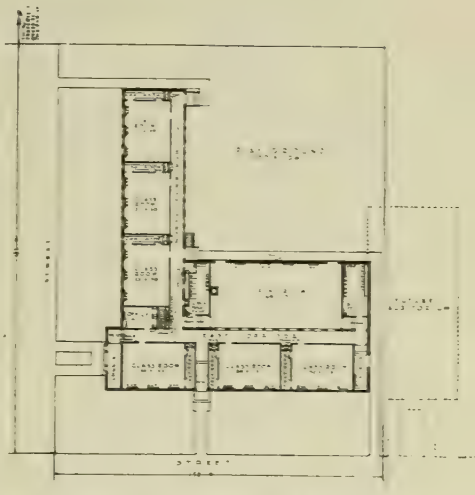
this article "Isis" expresses his own . which are not necessarily ours; we publicity to them as they are relevant ent discussions.—Ed.]

ou the extent of its recent gatherings and nes, architecture is just now very much e limelight. This is altogether good for ecture, yet it is not altogether good d it lead us to forget the problems sur- ng the art, which tend to become l under the very activities which are ised to promote it. A good many may el altogether satisfied that the recent rence on architectural education has much new light on the subject. To looker, obstinate questions obtrude them- . emphasised by the amount of pub- bestowed on architecture to-day.

roice here and there at the Conference ed a doubt, or suggested a difficulty ls the solution of which no answering replied. Indeed, though in so many informative of what the several schools ing, the discussions touched directly no rital consideration in the sense of re- g a perception of the gravest problems which the architect has to deal. We and we go away with doubts unre- . in fact still ominously clamouring."

d Crawford, in his speech at the Con- e. tells us "architecture would never stice to itself if the architect were ed from the actual handling of the al on which the result of his concep- epended," and this view, so recurrent eally, finds no nearer agreement as to that really means. Let us try to tand better the implications of such a of view as it applies to the architecture time. Few of us any longer believe r the architect to have a mere tinker- quaintance with the crafts, to dabble delling arrayed in Sussex smock, or to an amateur's acquaintance with the of modelling woodwork, stone carving, metal work, masonry, etc., when the of his present work permits him, is any n—besides it is not possible. The diffi- not thus to be got rid of; moreover, ls the distance of many architects from derstanding of the mystery of treat- nd of what constitutes vital craftsman- nat they should think in thus dabbling as to be found any key to it.

is true this defect exists it will be remedied by increased appreciation in ishing what has vision and treatment e prevailing more or less mechanical tes for both. It is not unusual to ports giving particulars of a recently church which tell us that the archi- igned everything, not only the fabric, carving, the windows, metal work, designed by the architect" the of it all. It does not matter who does k, so that it is done, nor that the should be bestowed unfairly, but it ses what is called the exceeding of the single mind. What a vast mis- n lies here, what lack of self- e that we should accept such a con- n. Either the statement is the ment of the poverty and lack of inspiration governing what has been the work is not so done. And if so affords the most striking evidence of the architect appreciated what was to a work of art. Only when he re for art will he feel the need of corporate relation through which strength is maintained and extended. re referring only to what is ob- y many, none the less recog- t there are architects fully sensible to the better view, and as anxious ualities of vital craftsmanship as



We read that at the Conference it was stated by the architect of the Woolworth building that architecture naturally reflects the spirit of the times. Does the spirit of our time and its reflection in architecture leave us in no doubt for the security and progress of architecture itself; that the influences governing the new Regent Street, for instance, are those which it may most happily absorb? Building, so we are also told, expresses the social conditions of the time. If the time were one of slum buildings should we say that such conditions were favourable to architecture? And if the time instead promotes salesman architecture predominantly, we are certain that this leads towards its best expression? The spirit of the times is, after all, only the shadow of our selves, and there is danger surely in phrases which really mean so little and yet sound axiomatic from mere repetition in the ears of those who never think.

It is not so much a question whether the architect accepts what Professor Richardson calls the "realities" of to-day, as whether those realities are as real as we think them. We are told by a speaker at the Conference that the appreciation of scale is impressed on students, but what have our streets to reveal in regard to these appreciations?

It is not quite the case, however, as is sometimes assumed, that a fine historic building, by this disregard of scale in a new building near by, is thereby destroyed, though the disregard of civic obligations for merely utilitarian advantage, ignoring the claims of other buildings and the traditions and character of the locality, is much to be deprecated. But the beauty of a fine building is not so destroyed. For to take the case of the Bush building, the beautiful little Wren church adjacent takes on quite a new loveliness from the juxtaposition. There it stands in no way dwarfed or thwarted by the building near by, the beauty of this little church is not made less, but more deeply impressive, welcoming us by its humanity.

The architect, it seems, needs rigorously to refuse ornament or addition to his building which is not justified by the reality of its conception and treatment, and which is merely a use and wont, stylistic or other, now become wholly vicious. We are told that a building should find its construction in the reality of its purpose, which it should express. The same reality is used in all that adorns it. Ornament must also express that reality which in its own case is seen in the vision and endowment of the craftsman. In that case we should no longer perpetuate the semblance but achieve the reality.

The distance of the architect from his workmen is one not to be dismissed or overcome by his own amateur craft practice. It lies much deeper in the constitution of society, which is different from mediæval times. The bourgeois architecture which dates from the Renaissance gradually detached architecture from its closer human relationships, intervening with a more scholastic and theoretic substitute for the more direct contact with materials and more communal relationship which left no such gulf between the architect and those he employed as now exists—he, the master builder, being then related by a fellowship of work that bound them all together. Far more democratic and dwelling in a mutual and equal relation there was no need for talk of a "mistress" art to palliate the loss of its reality. The emphasis of professionalism with its theoretic culture and exclusiveness, has undone with one hand what it achieved with the other. Will Lord Crawford tell us, in addition to pointing out the need for the architect having closer relationship with the "actual handling of the material on which the result of his conception must be imposed," how under present conditions this is to be obtained? Otherwise what is the use of stating things for which we have no solution to offer? And are we facing the problem for architecture in leaving them unsolved? Academies and degrees do not solve them for us, unless through them we can release the creative imagination which expresses the best aims of architecture. The "greater recognition of architecture as a profession" leaves us where we were, and when we are also told that imagination "transformed and glorified the art" do we realise that the scope for imagination depends on what it has to work upon? The shop front may inspire it, or it may not. And here the disparity between prevailing commercial ideals of using art to "sell the goods" and the scope for imagination emerges often as in direct conflict. For are not the aims of commerce seen in the new Regent Street prevailing over Norman Shaw!

St. Luke's Parochial School: Plan. Messrs. Dean & Dean, Architects. (*See p.* 2 6).

But it is not only what lies within, but what withstands architecture from without that presents so much difficulty. To unite the aims of commerce with the freedom of architecture, so that a conflict of purpose should not exist between them, is impossible unless life is united by an outlook shared more together. How are we going to reach this more single aim, to unite also the aims of architecture so that there may be restored that close inter-relation between architect and worker, one in which he is identified by a closer contact with materials freed from bourgeois prejudices?

It appears that we tend in our conferences to move amid nebulous affirmations and are in danger of forgetting the gravity of the issues that lie in front of architecture. And the same may be said of other expressions in present popular use. We hear of the "complexity" that prevails—which is indeed the case, but does that complexity so compel us that we must needs accept it and work amidst its enormous burdens and complications, or does it not suggest to us to seek a simpler way? All this needs an answer. Is it not rather a higher wisdom to ask ourselves what is the object of it all. How does our labour minister to life, towards its freedom and happiness? What is our part in it all? Architecture can bear witness to this against the destructive forces imperilling European civilisation to-day, but not by accepting only, not by phrases about "the spirit of time, or by accepting complexity, but by keeping its ideals pure; by resistance as well as agreement, guided not by the colour of the time against which all its educational schemes are so weak, unless fortified by that which transcends learning and is the answer of the individual to what he finds to be the meaning of life.

GRAVENEY CHURCH, KENT

By RICHARD BLOXAM

GRAVENEY CHURCH stands about four miles from Faversham, on the edge of the marshes that lie between that town and Whitstable. From the churchyard gate there is a charming view across the marshes, the monotony of which is relieved by sundry grassy hillocks, to the lofty, tree-covered ridge of the Blean Hills beyond. There is something attractive and imposing about the aspect of the church from this point, with the long-pitched red-tiled roof of its nave and the upper part of its strong, simple tower showing behind at the west end of the north aisle, a somewhat unusual position. And yet we are hardly prepared for the extreme beauty and interest of the interior, which is spacious and, owing to the small amount of stained glass, unusually light, while the red-tiled floor and box-pews give it a delightfully old-world appearance, as if one were looking at an old print.

The late Dr. Cox and other authorities on church architecture have laid it down that the examination of a church should always begin from the exterior. Mr. C. E. Keyser, however, that skilled and loving describer of churches, always starts from the east end of the interior; personally, I like his method, and propose to follow it in this article, after premising a few words as to the general history of the building.

There was a church on this site before the Conquest, but the earliest parts of the present building are the chancel arch and the west wall of the nave, which are both Norman. Two corbels still remaining in the south aisle, and the fact that some of the timbers of the nave roof were found during repair to have been shortened at some period, point to the church having formerly possessed narrower aisles than at present. Either these were part of the Norman church or they were added in the thirteenth century, when the present tower was built, and the chancel rebuilt, although on the same foundations. The present aisles were constructed in the following century, the north arcade dating from about 1320 and the south from some twenty years later. A few windows and the west and north doorways were inserted in the fifteenth century, but no further additions were made to the fabric with the exception of the south porch, which appears to be post-Reformation. Fortunately, the church suffered comparatively little from eighteenth-century restorers, but the quite recent restoration of the exterior was, in some respects, not too judiciously carried out. Funds are now, I believe, being collected to complete the restoration of the interior, in which it is to be hoped that the characteristic features of the church will be respected.

The interior dimensions are as follows:—Chancel, 19 ft. by 15 ft. 6 in.; nave, 53 ft. by 18 ft.; north aisle, 40 ft. 6 in. by 13 ft. 6 in.; south aisle, 54 ft. by 13 ft.; total length, 75 ft.; width across nave and aisles, 49 ft. 6 in.; tower space, 10 ft. by 10 ft.; porch, about 8 ft. 6 in. by 8 ft. 9 in. The material is chiefly flint with ashlar quoins.

THE CHANCEL.—The chancel is aisleless and of modest dimensions compared with the nave. The east window is Perpendicular of three lights; the plain hood-mould of a former larger window remains above (*cf.* description of exterior). Near the east end of the south wall is a piscina under a cinquefoil head; the projecting part of the circular bowl has been broken off, but the old movable wooden credence-shelf still remains. Immediately west are the curious late fourteenth-century sedilia, consisting of two seats of unequal width; the eastern and narrower is included under a cinquefoil arch, the western under a plain four-centred arch, both resting on shafts with moulded caps and bases; each compartment has a rectangular frame. The whole design has a plain label and battlemented cresting. Above is a square-headed, single-light window of about the same date, with good, simple tracery and a little old glass in the head; it is deeply splayed and has a segmental interior arch. Next comes a plain pointed priest's doorway, and another square-headed window with considerable fragments of old glass and a narrow pointed interior arch. In the north wall are two plain lancets, widely splayed, and farther east a small wood-lined almery with the holes by which the shutter was formerly fixed. There are two poppy-head benches in the chancel which are excellent examples of their kind; both have panelled and traceried backs, and the longer has a band of hanging tracery below the seat. The pitched roof is modern, but the wall-plates and cross-beam are old.

The round-headed Norman chancel-arch is very plain; it has grooved abaci with a hollow chamfer, but no capitals. The eastern angles of the jambs have been splayed off to a point in a curious way many centuries after the building of the arch. On the soffits are traces of painting, which consisted of intersecting lines forming rectangular compartments each containing an asterisk.

The church is fortunate in retaining its mediæval rood-screen, in which two interesting features may be noted—first, the apex of the arch in each compartment does not reach to the cornice, but remains suspended, as it were, an inch or two below it; second, that some of the bars of the tracery are battlemented, a somewhat inelegant feature also found in

windows of the same (fifteenth century) per

resting on a lion; the tomb resembles le the sedilia, the date of which e approximately the same. On the ear is another fragmentary brass and ents of two others. Over the Faversham a window of the same pattern as the indow of the nave, and another similar st of it. Then come the plain south y and a cusped ogee lancet, rather splayed. The west window is like the the south wall. Beneath it is a good th-century chest with four arches and roughly incised on the front. From ot it may be seen that the old on which the Creed and the Lord's were painted have been cut up and the construction of the batch of three y the west door—a proceeding more ical than desirable! The Perpendicular s a bowl with eight octagonal faces, which have conventional roses and one de-lis; the others have shields, one a plain cross, another some of the nts of the Passion (cross, nails, and f thorns), while the other two bear charges which have not been identified.* re some old poppy-head bench-ends to the woodwork of the pews in this

leaving the interior of the church, let der once more the quality of lightness as been noticed as one of its charms. there is no "dim religious light"—hardly desirable, when one comes to it, in a building where people are to be able to read from books! Beauty duce a religious atmosphere without of permanent twilight. The Gothic as his skill increased, built larger and ndows and, when he filled them with glass it was glass that admitted, not light, as do the majority of the modern with which pious but misguided fill our churches. As for box-pews, se few people would defend their use congregational point of view; yet interest demands that they should tact in at least a few cases. The con- at Graveney is probably not so great y persons have to sit with their backs ltar! If so happy a thing were to e ought readily to forgive the removal ews.

pleasure to remark that the church is y kept; the floor, which in nave and covered with cheerful red-brick tiles, ly clean, and the brasses on the floor brass handles of the pews are kept brightly polished. There are no coverless prayer-books or bursting hassocks lying about. A word, too, must be said in favour of the simple, nicely designed chandeliers, which have prettily painted rims. The church also gains architecturally from the fact that none of its space is blocked by an organ. There is a small, worn-out instrument in the north aisle—the "poor relation" of an organ, a "harmonicon" or something of the sort—with a pretty case and an elegant row of little gilt pipes.

THE EXTERIOR.—The exterior is, as a whole, of far less interest than the interior. The chief merits of the tower are simplicity and strength, but the design, as with many Kentish towers, is plain to the verge of poverty. The north and west walls are in a line with the corresponding nave walls, but the west wall batters slightly at the base. This face has four small plain lancets one above the other; the north face an oblong slit and three lancets; the other faces one lancet each. In each face, a little way beneath the low heavy battlements, is a small quatrefoil piercing, and below this a plain chamfered string-course. The semicircular stair-turret on the north, with conical top, appears to be a later addition.

The north windows of the north aisle have plain labels. They are separated by four good plain buttresses of two stages, and there is a similar one against the east wall. These had been well repaired in brick during the eighteenth century, but this evidence of the care sometimes bestowed on our churches even in those "dark ages" was quite needlessly removed at the recent restoration. Like the buttresses of the same pattern on the south side of the church, they are of the same date as the aisles. The east wall has low battlements; otherwise both aisles have poor shallow copings, and their roofs are invisible from the ground—a distressing feature.

The chancel is without buttresses; the lancets in the north wall have no dripstones. The dripstone of a window larger than the present one remains on the east wall; this belonged to the thirteenth-century work, as shown by the character of the head in which it terminates on the north. As it was very unusual to replace a large window by a smaller one, we must assume that this wall had shown signs of insecurity. Why the missing part of the dripstone should have been restored (the existing window below has one of its own) and a brand-new mock-archaic head furnished for its southern termination, is hard to imagine. The south windows have plain square labels.

The south aisle has diagonal buttresses at each end, but no others. The dripstones of the east window and the two-light windows on the south have been (advisedly) much restored, but only one of the original heads is missing, and no substitute has been provided for this! One of the heads to the east window is that of a bishop; the easternmost on the south is a female head of great beauty. The south porch is plain and ugly; the inner doorway has had the heads of its dripstones hacked off. The single-light window west of the porch has no dripstone; that of the west window has no heads.

The west end of the church has a buttress (the only one that has not been restored) against the termination of the south arcade, but none corresponding to it on the north, the tower making it unnecessary. From here the greater thickness of the Norman west wall as compared with that of the aisle can clearly be seen. The heads terminating the dripstone of the west window are exceptionally well carved; indeed, though none of these heads is of that delightful, quietly humourous type that is so often to be met with in the district, they are all well worthy of study. The dripstone of the west door has shields which must once have borne painted charges.

The tower contains four modern bells.

[The photograph of the interior is by Mr. W. Hargreaves, photographer, Faversham. The negative from which the other illustration is taken has kindly been lent me by my friend, Mr. C. H. Drake, of Faversham, to whom I am also indebted for much information respecting the church.]

ILLUSTRATIONS

New Business Premises, Oxford Street.

The illustration we give this week is a perspective view of a sketch design for business premises in the West End, with a frontage of approximately 240 ft. The premises will be of skeleton steelwork construction and fireproof materials throughout.

The elevations to streets will be faced with Carrara ware, the columns to top story being in Hopton Wood with bronze caps and bases. The ground floor windows will have Hopton Wood surrounds filled in with bronze window sashes, and the upper floor windows will have similar frames and bronze panels at the different sill levels. The height to top of main cornice is 90 ft. from pavement level, and the whole building will have a sub-basement. The main roof will be flat covered with asphalte, and the centre feature will be covered with red pantiles.

The architects for the work are Messrs. Gibson & Gordon, FF.R.I.B.A.

Scheme for a Repertory Theatre at Cairo.

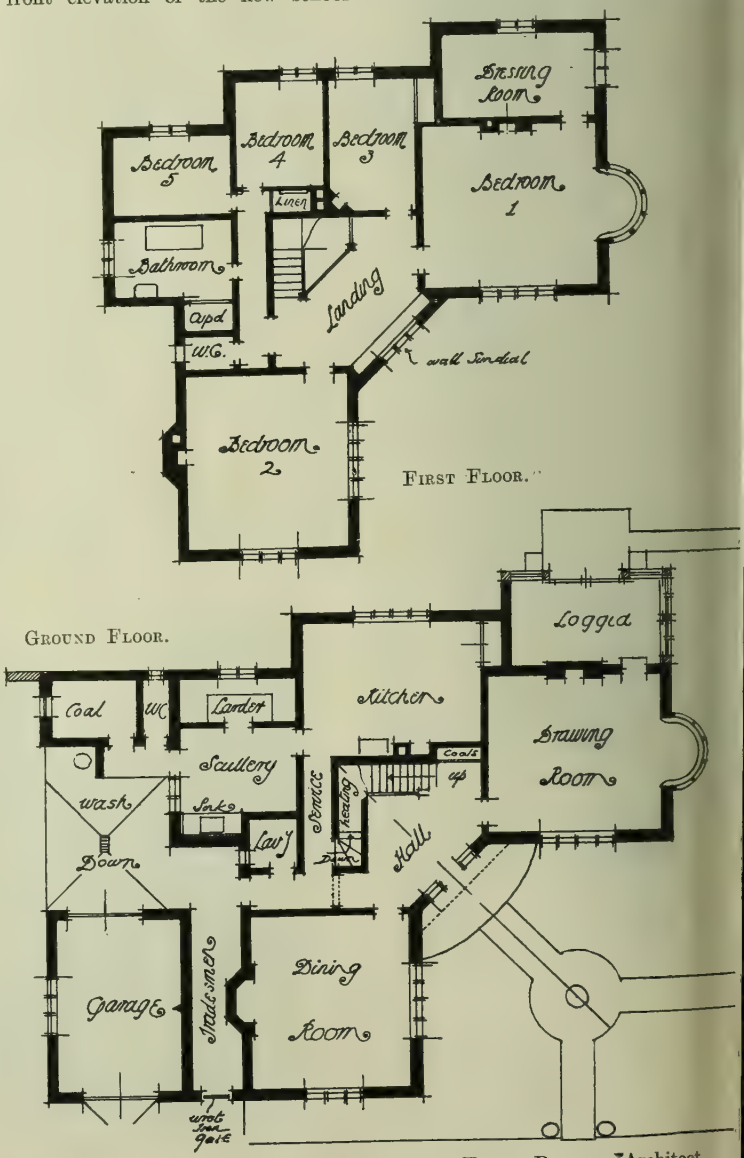
The drawings illustrated are part of a set of sixteen working drawings submitted by an Egyptian student at the School of Architecture, Liverpool University, at the end of his five-year course leading to the degree of Bachelor of Architecture with honours in architectural construction. Every student at the Liverpool School, before he can sit for his degree or diploma, has to submit a design to an approved programme. This design he makes by himself. If he is a student aiming at honours in architectural design, he chooses some subject which allows him to show his powers of composition, detail and decoration, and submits a set of large rendered drawings, about on the scale of those submitted for the final round of the Rome Scholarship. If he is a specialist in construction and aims at a degree or diploma with honours in that subject, he submits a design of his own but carried to the stage of working drawings. These working drawings of Mr. A. L. Gabr's, which were one of the chief exhibits of the Liverpool School at the recent exhibition at Devonshire House, show the standard which must be reached for a good degree at Liverpool. The thesis which the student does by himself is considered the climax of the student's career. In it he should show the result of the teaching he has received during the previous five years.

This particular design of Mr. Gabr's was awarded the first Holland and Hannen & Cubitt's prize for the best set of working drawings made in the School during the Session just past. The second prize was divided between Mr. Turner, who obtained an honours degree in construction and submitted working drawings of a large hotel on the scale of the Adelphi Hotel, Liverpool, and Mr. Miller, who obtained a pass degree and submitted working drawings of an office building.

House at Gerrards Cross.

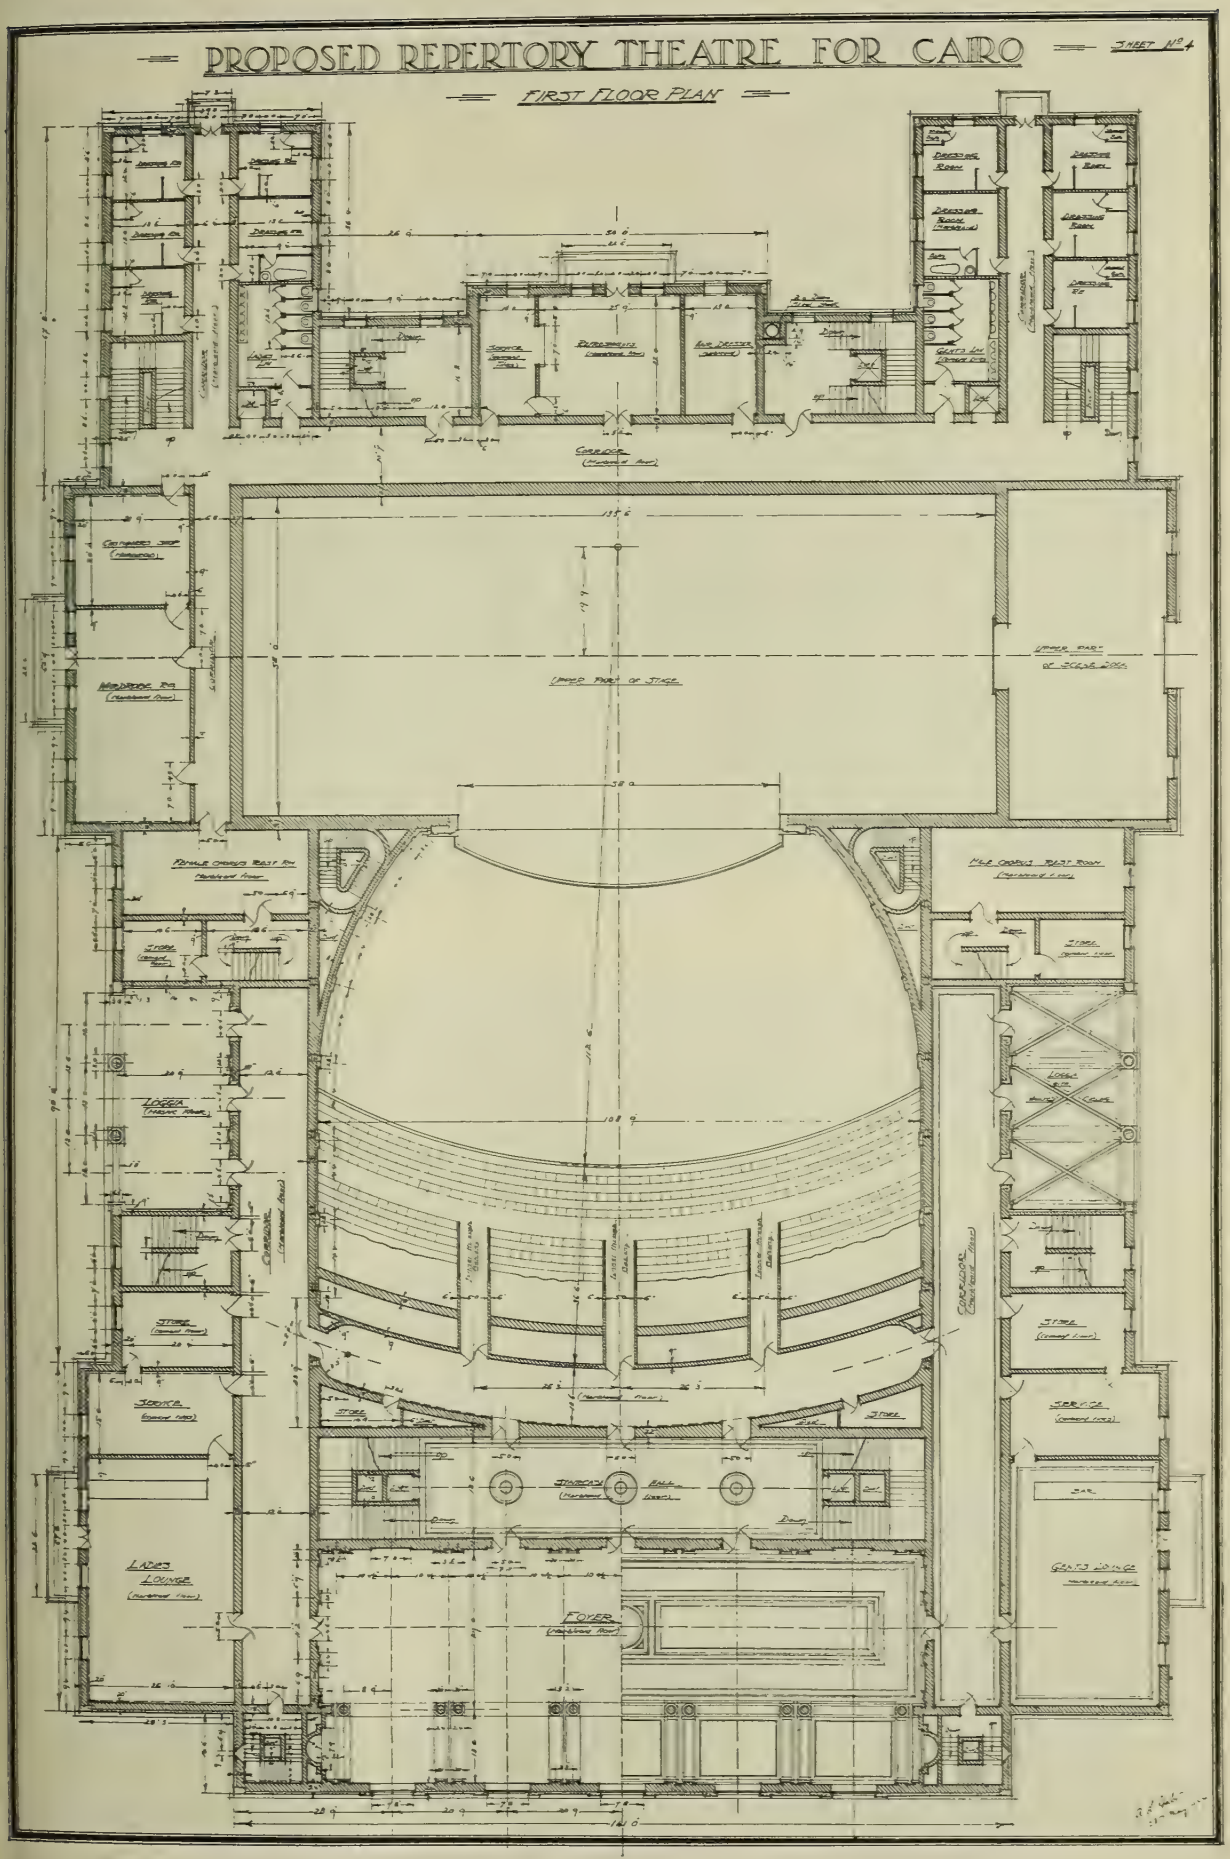
This house is built of local hand-made bricks roofed with dark hand-made tiles. It is set well back from the road in the centre of a cherry orchard. The plan is "L" shaped and so planned that the chief rooms get the maximum sunshine possible. The angle forms a sun-trap. Some fine old panelling, shown in the photograph of the dining room, was taken from a Hertfordshire farmhouse, where it was found behind a coating of plaster and paper. The casement and leaded lights were supplied by Messrs. George Wragge, Ltd.; the central heating and domestic hot water supply carried out by Messrs. Benham & Co.; the house was built by Mr. Frank Greer and designed by Mr. Edgar Ranger, 9, Gray's Inn-square, London.

The Henrietta Barnett School, Hampstead Garden Suburb.



This building has been erected as a girls' high school to accommodate 220 pupils. It is, in effect, an extension of the Hampstead Garden Suburb Institute, which it adjoins and which was erected before the war from the designs of Sir Edwin Lutyens, R.A.

The Institute contains a large hall and other accommodation, which will be used in conjunction with the new school buildings. The plans of the new building were prepared by Mr. John C. S. Soutar, Lic.R.I.B.A., architect to the Hampstead Garden Suburb Trust, Ltd., and the work has been carried out under his direction.



The lay-out of the central square required that the front elevation of the new school should practically repeat with that of Institute, the buildings being symmetri situated in relation to the centre pathwa the square. In planning the building, ad tage has been taken of the south and aspects for the class rooms, while rooms w do not require such a large window area been placed on the elevations where symm of design with the adjoining building had observed.

The main walls are faced externally with silver-grey bricks with Portland stone an brick dressings. The roof is constructe steel trusses and is covered with thick face, hand-made tiles. The floors and cases are in reinforced concrete throug the treads to stairs being in teak. The floo covered with 1¼ in. thick pitch pine wood b laid herring-bone fashion. The floors to tory and cloakrooms are covered with 9 in. red quarry tiles, and coved tile skirting used throughout all rooms. All classroom corridors have dados of Willesden can

The general contractors were Messrs. Roome & Co., Ltd., and the following contractors were engaged: Portland stone Perry & Co.; wood block flooring, Acme Co.; sanitary fittings, Alfred Goslett Ltd.; reinforced floors, Trussed Concrete Co., Ltd.; school furniture, Educational Association, Ltd.; carving, J. Bysouth. facing bricks and roofing tiles were su by Messrs. S. E. Colliers, Ltd., of Re moulded bricks being used in sills, cornice

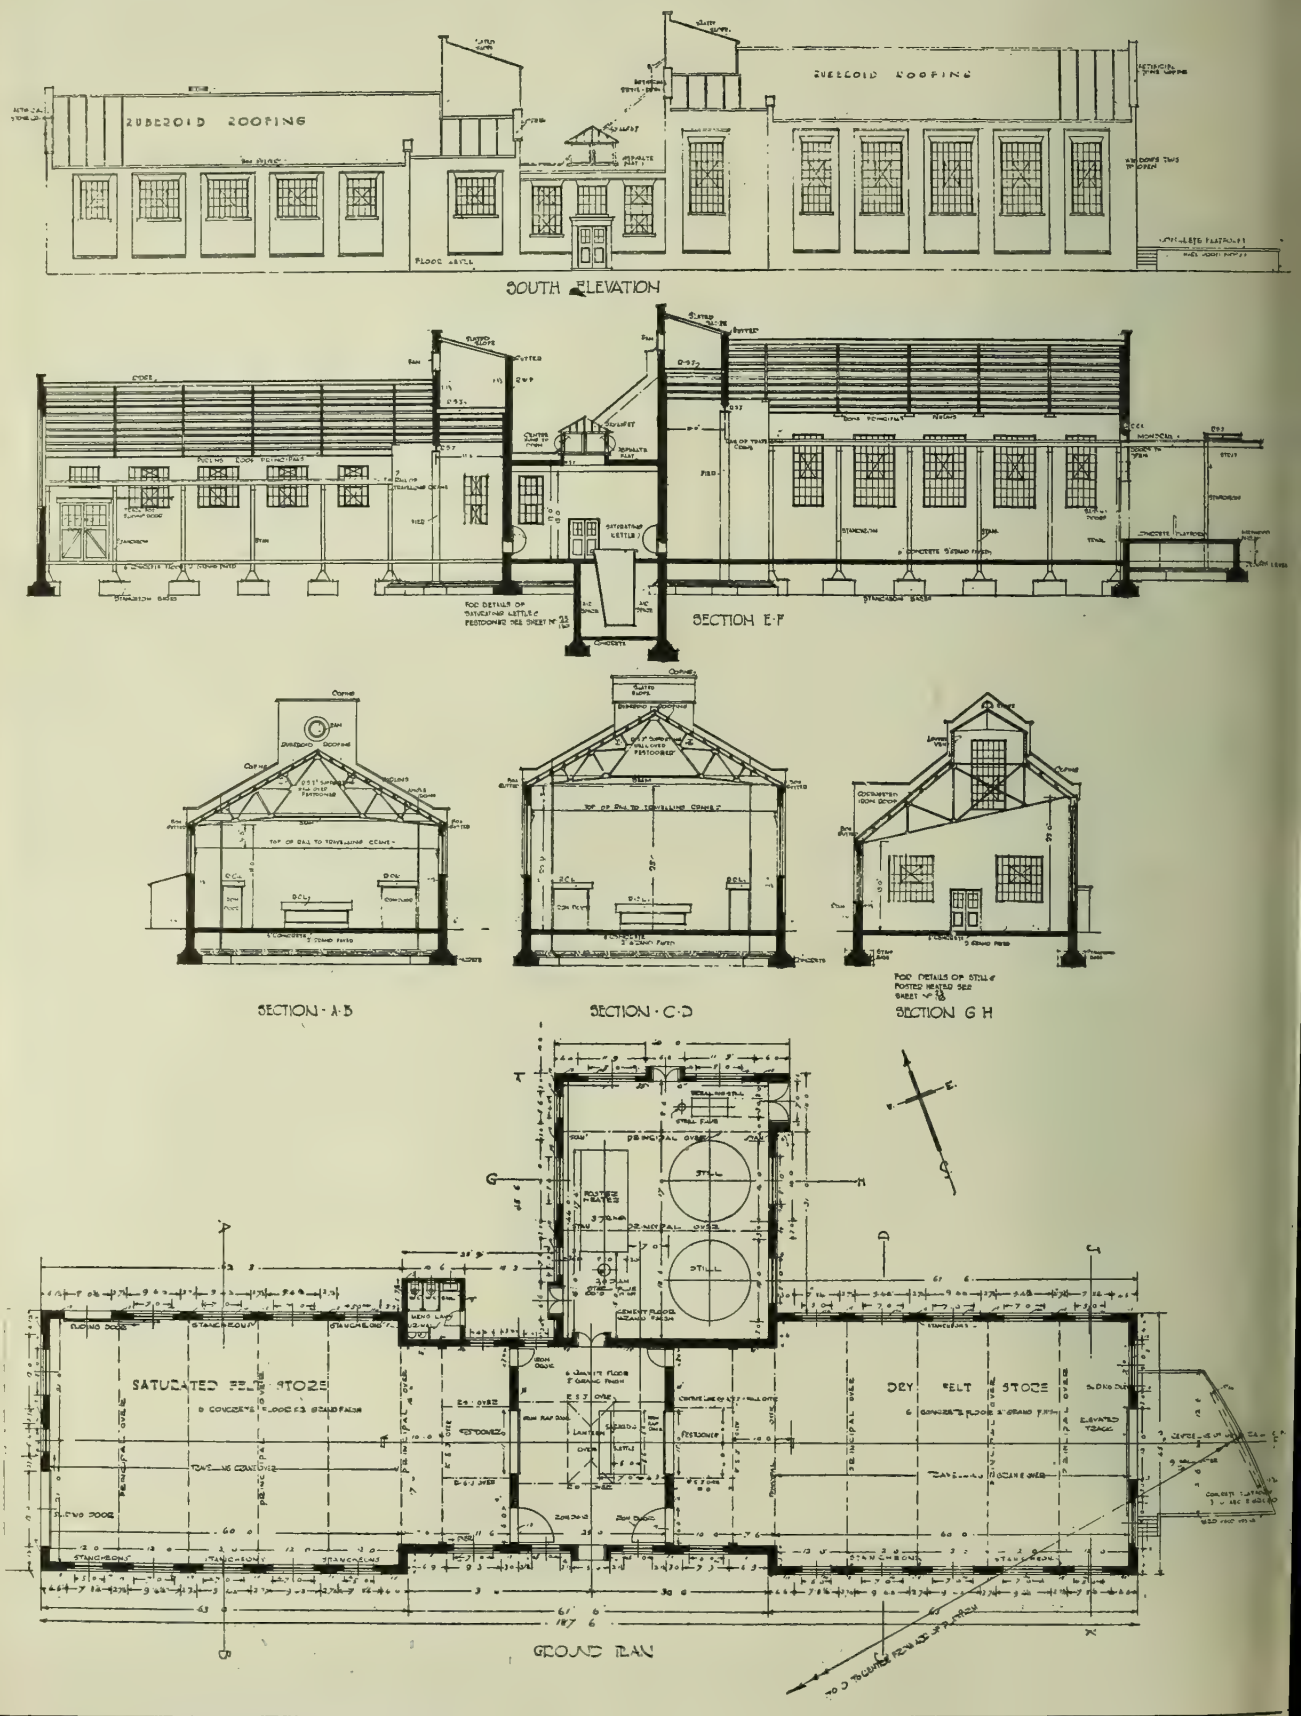
This factory was designed for a large open level site at Brimsdown, Middlesex, for the Congoleum Company, Inc., U.S.A., as their European headquarters for the manufacture of the well-known Congoleum squares These buildings were designed as the nucleus of a large scheme, which would, when completed, possess a working floor area of several acres.



floors used throughout. The flat roofs would be covered with asphalte, and the sloping roofs with slates, galvanised iron or Ruberoid, depending on the special use of the building.

From a constructional point of view, the print room is the most interesting portion of the building, as here the necessity of a clear open floor to receive the travelling printing machine has necessitated the elimination of stanchions, and the asphalte finished slab roof is therefore

New Colindale Station for the Underground Railways. MR. F. A. HEATS, Architect to the Underground Railways

NEW "UNDERGROUND" STATIONS

THE new Underground line to Edgware, which was opened last Monday, includes several new features in railway station architecture. The Underground Company has evidently been actuated by a desire to impart a pleasing outline to structures planned on strictly utilitarian lines. Of the stations which we illustrate this week, Colindale is a red brick building of Georgian style, square in plan, with a clerestory and a pyramidical red tiled roof having wide projecting eaves. The front elevation has a Doric colonnade portico of Portland stone. The interior comprises a commodious booking hall and various offices, &c.; the floor paved with black and white tiles, and the lower walls faced with white glazed tiles relieved by green. Edgware station comprises a centre and wings which form three sides of a quadrangle 100 ft. wide by 69 ft. in depth. The elevations are of Portland stone, with a Doric colonnade along the centre and west wing. The main entrance, in the centre, is flanked by small pavilions, which break the roof line of this facade. The east wing will contain a row of shops, divided by Doric columns to preserve the harmony of the elevations as a whole. The roof, of somewhat high pitch, is covered with Italian tiles. The colonnades are paved with red and buff tiles; the booking hall, which is in the centre, with black and white tiles, while the lower walls of the interior are faced with white glazed tiles, formed into panels by green borders. The joinery, throughout, is of polished oak, with bronze fittings.

To facilitate the working of early and late service over the Edgware extension a new car shed has been built alongside the Edgware terminus. It is 402 ft. in length by 69 ft. wide. The outer walls are of Dorking mottled bricks; the roof of steel-truss type, covered with flat red tiles.

The opening of this extension has led to considerable activity in building operations. New roads have already been formed, and blocks of shops are being erected immediately opposite the Edgware Station. Numerous houses are also being erected.

The contractors are as follows:—Edgware Station: Sir Lindsay Parkinson; Burnt Oak sub-station: Messrs. Ford & Walton; Colindale Station: Sir Lindsay Parkinson. The Underground Co. are their own architects in each case.

EXHIBITION NOTES

International Exhibition of Modern Decorative and Industrial Arts.

WE take the following extracts from a communication which has been issued by the Department of Overseas Trade in connection with the Exhibition which will be held in Paris in April, 1925.

The British section will comprise a single-storied pavilion covering about 8,000 sq. ft., together with an annexe built on a platform measuring some 5,000 sq. ft. overlooking the Seine and containing a small restaurant and roof garden. For these buildings an excellent site at the north-west corner of the Pont Alexandre III. has been allotted to this country. Space amounting in all to 25,000 sq. ft. has also been provided for British exhibits in the Grand Palais, together with a further space in one of the buildings to be erected by the French authorities in the Esplanade des Invalides.

It is not proposed to invite exhibitors to take space within the British Pavilion, but to treat the Pavilion as a national exhibit. The building itself will constitute an example of architecture and the allied arts of the United Kingdom, and it is proposed to select, with the assistance of expert committees formed for the purpose suitable objects of the l quality and artistic distinction for within it.

As regards the space allotted t country in the Grand Palais, and in the ing in the Esplanade des Invalides, t partment will offer space to firms who take part in the Exhibition. It will be sary to make a charge of 10s. per sq. order to defray a part of the ex involved, which cannot be wholly me the grant of £30,000 made from public towards the cost of British participation. charge will cover the cost of the g scheme of decoration, lighting, the attendance and cleaning but not th special stands or fittings.

In order to ensure that exhibits may the necessary standard of artistic me comply with the conditions of the exh they would, before admission, be sub scrutiny by Committees of Experts. T hibition will afford an exceptional oppo of showing to the French and to th number of foreign buyers who visit Pari larly in order to purchase the various of goods which fall within the scope Exhibition, that the products of industry are in no way inferior in merit to those of any other nation. this opportunity is to be exploited measure, it is necessary to secure the co tion of the foremost designers, produc other experts, and also to ensure th tenance of a high standard of j selection.

Gas Fires.

At an inquest recently on a child the Fulham coroner suggested th Children's Act, which renders obligat use of a guard before an open fire, sh so constructed as to include gas fires.

Approach to Edgware Station. MR. F. A. HEATS, Architect to the Underground Railways.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

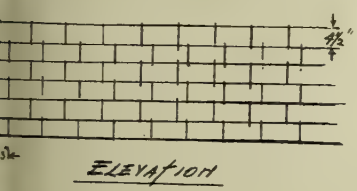
We are glad to give questions and answers cannot accept responsibility for contributed es, especially on legal matters.

ay we appeal to our correspondents to nit their queries on paper of a size easily , and written as legibly as possible, or r still, in typescript?—ED.

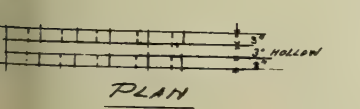
Cost of Building Hollow Walls.

[REPLY TO M. D. R.]

R,—The cost of building the wall shown 14 in. brickwork with a 2 in. cavity d be about £30 per rod plus about £2 od for extra cost of wall ties and plumb- wo faces if galvanised iron ties are used; bout another further 15s. to £2 more if ware tie bricks are used. The latter are r the best, being indestructible, but they seldom used in modern practice though often wonders in what state the iron ties be in a hundred years time or less.



e cost of building the second wall shown 9 in. brickwork separated by 6½ in. con- presumed to be 1-2-4, would be about 10s. per rod super (not reduced) plus of concrete which would be about per rod, plus the cost of extra wall ties about £1 per rod. The s are, therefore, in favour of the ary cavity wall. It will, of course, be stood that the actual prices vary widely fferent districts, but the comparison will uch the same, except that in a district bricks are difficult to obtain at a et price, and good aggregate is handy, cale may be turned in favour of the ete-filled wall.



ave not before me to-day's prices for n rock but should imagine that to fill n. cavity with this material would cost £5 or £6 per rod extra, and I should ecommend the use of wall ties, in case perfect filling.

"BRICKS."

Laying of Bricks.

—Why are bricks not laid on edge for ng purposes, as shown on sketch? For

le, in a 9 in. wall 21 ft. high, we require ers when constructed in the ordinary way, inst 56 layers when bricks are laid on This would mean a saving of one-third nount on bricks, mortar joints and labour ly a point worth considering.

V. J. WENNING.

Corrugated Iron.

[REPLY TO "Z."]

—It is probable that the corrugated as not specially and properly prepared painting, in which case the paint be thoroughly removed by scraping and well brushing with a stiff wire brush and the surface treated in the following way:—

Apply the following mixture—1 part chloride of copper, 1 part nitrate of copper, 1 part sal-ammoniac, 64 parts water added to 1 part commercial hydrochloric acid. Leave on for twenty-four hours and then apply Torbay paint or coat only with bitumastic paint which may be obtained in various colours.

It might be pointed out that "Red Oxide" is a loose term that may be applied to a composition containing only 20 per cent. or less of oxide where nearer 80 per cent. is essential. Some of the preparations applied to ironwork under this heading are quite useless as a protective covering.

"TURPS."

Leaking Walls.

[REPLY TO ARCHITECT.]

SIR,—The crazing of the cement surface is probably due to the use of too rich a mixture of cement in the first place. The best cure will be to rub down and remove the distemper and coat with fairly strong cement wash to fill in the cracks and applied with a brush. The surface may then be re-distempered.

H. B.

Cement and other Foundations.

[REPLY TO CLERK OF WORKS.]

SIR,—A good blue lime mixed in the way recommended will make a very fine foundation, but there are many limes that prove inferior to cement in every way as weight-bearing concrete, and tested Portland cement shows better results under test for crushing than any lime.

The archæologist's objection to the use of cement savours a little of pedantry, if one may say so, as there is no known reason to doubt the lasting properties of this material, limited as our experience of it may be. However, there is nothing in the method proposed that can be objected to provided a good lime is used.

"UP-TO-DATE."

Floor Treatment.

[REPLY TO J. T.]

SIR,—There is no better treatment for oak floors, both for appearance and wear, than the good old-fashioned beeswax and turpentine freely applied and well worked in. It gives, of course, a slippery surface which may be objected to in club premises, but this may be obviated by the subsequent application of one of the non-slip polishes now on the market, though these are really forms of varnish. The figure of the wood may be further emphasised by first treating the wood with ammonia rubbed in with a rag, which is merely a way of hastening the mellow tone which oak will assume in time if left to itself.

"ELBOW GREASE."

Oak Timbering.

SIR,—Can any of your readers advise me the best ways and means to darken down to old weathered colour the oak adzed timbering of an old design cottage I am just building?

I have been a reader of *The Builder* many years, but cannot remember this question being asked or replied to in any of your previous issues.

THOS. M. COUZENS.

Electric Cooking.

SIR,—An institution in which I am interested desires to install electric cooking for 100 people, and the basic point is the cost of working. The makers differ so much in their estimates of consumption of current that I appeal to one of my own trade to tell me if they know of a system of about that size and its consumption of what I believe is called "juice."

"COUNTY COUNCILLOR AND BUILDER."

Architectural Data.

SIR,—Can any reader inform me from what sources I can obtain reliable information relative to the dates, architects, and past histories, of many of the lesser known buildings, town and country houses, and churches, &c., abounding in so many parts of the provinces.

Personally, my home is situated in Wiltshire, the home of innumerable objects of architectural interest, of which little appears to be known by local residents. Anxious to gain an authentic knowledge of these places of interest, I shall be obliged if any readers can kindly inform me from what sources I may gain such knowledge.

If any books are recommended which are not very well known, perhaps your readers will be good enough to give the name and address of publisher.

"RESEARCH."

HOUSING WITH STATE ASSISTANCE

THE following figures relating to the progress of house building under the Housing, &c., Act, 1923, have been issued by the Ministry of Health during the Parliamentary recess:—

(1) Houses authorised by the Minister of Health up to August 6, 1924—

To be erected by local authorities..	54,686
To be erected by private enterprise..	99,694
Total	154,380

(2) Houses included in definite arrangements on or before August 1, 1924—

Schemes of local authorities:	
Number of houses included in contracts or in approved direct labour schemes	35,921
Private enterprise:	
Number of houses included in undertakings given by the local authorities under Section 2 (3)	67,171
Number of houses approved by the Minister under Section 3, and included in contracts	5,688
Total (included in Table 1) ..	108,780

(3) Building Progress at August 1, 1924—

	Foundations.	Roofed.	Completed.
Local authorities	8,985 ..	6,565 ..	7,563
Pte. enterprise	18,850 ..	14,642 ..	14,389
Total ..	27,835 ..	21,207 ..	21,952

Note.—Tables (2) and (3). For 34 local authorities, from whom returns for August 1, 1924, have not yet been received, the numbers included above are taken from the previous month's returns.

HOUSING IN AMERICA

This quarterly journal* always includes a summary of housing all over the world, and this issue is naturally concerned with the advent of a Labour Government in England and with the Report of the Building Industry Committee set up by Mr. Wheatley. As to America: rent control is to continue in New York for at least another year, and the city is discovering what, sooner or later, we shall all recognise—that it is a great deal easier to pass rent-restricting Acts than to repeal them, even if the real necessity for them should no longer exist. In Philadelphia the tenement conditions appear to be on a par with those in Scotland, and they confirm one in the belief that tenements can only be satisfactory if built with extreme foresight and managed with minute care. Zoning is making great strides in America; in January last zoning ordinances were in effect in 221 municipalities, and during the year ordinances were adopted by 81 more municipalities with a population of about eight millions.

* *Housing Betterment*. May, 1924. (New York City: The National Housing Association.)

THE BUILDING TRADE

EDUCATION IN THE BUILDING INDUSTRY

AT the annual Conference of the Institute of Builders with the Teachers of Building in Great Britain, Mr. J. W. Riley, Head of the Building Department, Rochdale Technical School, read a paper entitled "Building Examinations."

In the course of his paper he said since examinations were a recognised means of testing the success of education work in general, he thought he might assume that they were an essential and important part of the instruction.

As the object of the meeting was to give consideration to examinations and how they might stimulate an improvement in the education of those engaged in the building trades, it seemed necessary (1) briefly to review the existing conditions; and (2) to discuss the possibilities of further developments in order to obtain greater efficiency.

It would, no doubt, be well within the memory of nearly all present that the Government Science and Art Department—later the Board of Education—held examinations annually in many science and art subjects, including building construction, geometry, mechanics, mathematics, architectural drawing, &c., while the City and Guilds of London Institute conducted examinations in such trade subjects as brickwork, masonry, carpentry and joinery, structural engineering, builders' quantities, plumbing and sanitary engineering, &c., and awarded certificates to the successful candidates. Those examinations, carried on for more than fifty years, gradually developed and proved a great stimulus in setting a national standard of scientific or technical training in many phases of industrial life, thus assisting a large number of enthusiastic young people in their studies.

In 1911, the Board of Education issued to educational authorities an important circular (Circular 776) in which they stated that it was desirable to make a change in the character of the examinations under their auspices. In this circular they gave notice of their intention to gradually discontinue the examinations, intimating at the same time that each educational authority should make arrangements for holding their own examinations in the future. In doing this the Board stated that the time had arrived when it was possible to allow greater freedom to schools both in the choice of material for instruction, and in order and method of treatment of many subjects. The examinations were, therefore, gradually discontinued, until in 1918 no examinations were held by the Board in science and art subjects except for scholarship purposes. It was necessary to point out that—(1) The Board's examinations were in single subjects; (2) the examination papers were prepared by experts who did not in any way consult teachers, or any one specially interested in the particular industry. With regard to the examinations conducted by the City and Guilds of London Institute, they, too, had been discontinued in England and Wales in all except the final stages of the various subjects.

While the training given to pupils in elementary and secondary schools was general in character, and aimed only very broadly at training them for particular groups of occupations, the training given to students in technical schools was usually specialised, and aimed definitely at giving knowledge of the scientific principles underlying their particular occupation. Formerly it was the custom to expect the employer to personally supervise the training of all the apprentices under his charge. Small workshops were the rule, most of the work done was by hand, and the employer, recognising his responsibility, took a very personal interest in the boys in his employ, saw to it that they learned their trade properly, with the result that a supply of properly trained craftsmen was not difficult to maintain.

At the present time, with much larger works, rapid developments of machinery, increased application of science to industrial occupations, greater competition, &c., it was necessary to have larger staffs of men with better trained foremen and leaders; the employer could not possibly undertake the personal supervision of all his young workmen, and the means of training—especially the educational and technical side—had devolved almost entirely upon technical institutions. If anyone had any doubts of the truth of this statement let him ask whether there existed any other large organised effort for the educational training of workers for the industry.

The objects of the examination of technical students might, therefore, be considered to be:—

(*a*) To test (1) their standard of proficiency in specified branches of knowledge; (2) their fitness for more advanced instruction.

(*b*) To provide a record of successes with due recognition of diligence and ability; to act as a stimulus for further e ort; to keep students in attendance to the end of the session.

(*c*) To guide teachers as to the standard to be expected at certain stages of instruction.

(*d*) To aid in the fixing and maintaining of suitable standards of instruction and attainment.

As examinations were considered necessary to test educational work it was, therefore, necessary to have definite curricula or syllabuses—set out in detail—arranged in an educationally progressive manner and covering each stage of the work. It might be argued that the ideal way of preparing syllabuses of instruction was to frame them without reference to an examination test, and to look upon such a test as a secondary matter only, to be considered after the courses of instruction had been thought out completely. It was, however, admitted by most teachers that the scope and method of instruction was controlled by the syllabus with an eye to examination results, and this should be fully realised in preparing schemes and in setting examination papers. That was, the examination should be so devised that they emphasised the educational value of the instruction.

It was quite natural that a student should wish to have some tangible and permanent record of his successes, and if, or when, this record was issued by a national body of high standing it had a greater value than if issued locally; it indicated that he had measured himself against a more numerous body of students, and had not fallen short of the standard laid down by an authority commanding general confidence. Again, a certificate on a suitable examination often had a considerable pecuniary value to a student who was also qualified in other ways, and might, with a sympathetic employer serve as a recognition of special ability, especially when taken in conjunction with personality and experience. From this point of view it would, therefore, seem that the proposals of the Board of Education to allow and encourage technical institutions in general to prepare their own schemes of work and examine their own students had not fully accomplished what was intended. The main weakness was shown to be a lack of general standardisation and, therefore, a difficulty in classification, owing to absence of uniformity, when transferring students from one institution to another. Recent developments, however, indicated that a satisfactory solution was in prospect as follows:—

Since technical institutions were the places where the instruction was given, with the object of improving the industrial capacity of the country, and because they were financed by public funds—partly by Government grants, and partly by local rates—there were at least three parties interested, namely, the Board of Education, as a Government Department, the local authorities, and industrial, professional and commercial organisations.

Building Advisory Committees.

Experience had shown that advisory mittees set up for each group of trade su provided a good means of arranging the cur and syllabuses of instruction. They we existence in some parts of the country, might be desirable to have the country into areas in such a way that each area tained both large and small schools. conditions would have to be considered they should be subservient to a general na scheme so that there might be a degr uniformity without too much rigidity.

The duties of the advisory committees to consider in detail each year's course of s linking up the various subjects; in su manner they provided a progressive an ordinated whole. An important point i personnel of the committees was that each mentioned parties should be represented the Representing the local education authorit was desirable that either the director of e tion or the principal of an institution shou a member, because of his responsibility t education committee for the working o institution as a harmonious whole. The l number of members should, however, cons teachers, taking care always that they truly representative of the various intere subjects taught. It might be necessary to out in justification for advocating this technical teachers were selected and appo because of their intimate acquaintance both the practical and technical or scie sides of the industry. As teachers with e ence gained in schools they not only knew was possible educationally, they were also competent to link the theory with the pra It might also be asserted that at present, e in the larger institutions where full time work was carried on, the majority of the tea held evening sessional teaching posts, as su mentary to their engagements in some se or department of the building industry.

Representatives of both employers employees were necessary because: (1) I essential to the industry that every encou ment should be extended to the young ap tices to become students of their part craft so that they might become eff workmen. (2) It was essential that should become acquainted with what was taught in technical institutions at the p time, and that they should take a sha arranging the courses of work in such in tions.

As a teacher he thought it necessa emphasise the importance of securing a co-operation than had hitherto existed the controlling forces in the industry.

The Board of Education was represent the advisory committees by His Maj inspectors. As it was part of their du visit all the institutions in the country a report upon the work carried on therein had the best opportunities of discoverin, were the "progressive" teachers; which the education committees most desiro progress, as evidenced by well-equipped rooms and laboratories, where apparatu abundant; and where the best faciliti studies were available. Possessed of this ledge they had an opportunity of seei situation from a wide and extended vie because of this could, and did, render va help to the advisory committees.

Courses of Instruction.

The course of instruction in the e classes must be either of longer durat more restricted in character than those in day classes. As the former largel dominated, he assumed courses suita them, although it was to be hoped th time was not far distant when the greate of the educational work involved in the ing of building students would be done day time.

It had already been stated that the dis examinations of the Board of Educatio

single subjects without any attempt to form
em into group course work. Experience had
own, however, that properly graded grouped
rses arranged over a period of six or seven
rs were much better than the single subject
thod.

The boys should be encouraged to take up
ning sessional study directly they left school
14 or 15 years of age. At least one—possibly
o—years should be spent in the preliminary
hnical course which should be common to all
dents of building, engineering, &c., after
ich the building student entered into his
cialised training for the industry. The
rk of the preliminary course included the
dy of English, practical mathematics,
ctical drawing and elementary science.
is gave opportunity for revision and exten-
n of their day school training, and had an
ustrial bias.

The students of 16 years and upwards might
w be classified as: (1) Those whose desire
s to receive instruction only in the subject
their own trade, and be confined to such
des as masonry, brickwork and concreting,
pentry and joinery (hand and machine work),
mbing, painting and decorating, &c. For
se a three years' course in which practical
rk was provided, and in which applied
metry and elementary calculations were also
orporated, would enable the students to
n much knowledge and give them better
nces of becoming efficient and intelligent
kmen.

t was possible, however, that many students
these trade courses might show exceptional
lity, along with ambitions, and might desire
ake (2) a more comprehensive course which
ld be described as a general building course,
which the aim was to obtain a general and
knowledge of the industry. This course
the one necessary for students who intended
become either architects, structural engineers,
ntity surveyors, master builders, supervisors
works, foremen, &c. This course occupied
ee years as senior work, followed by a further
years of advanced work. This senior
rse included:—

st year: Building construction, practical
metry, calculations. 2nd year: Building
struction, practical geometry, building
nce. 3rd year: Building construction with
least one other subject selected from the
owing: Practical geometry, building science,
lding mathematics, and, if necessary, one
er subject to be selected from the following:
lders' quantities, carpentry and joinery
oretical), brickwork and concreting,
sonry.

t would be noticed that with the third year
ior course many options were offered to the
dent according to his special inclination or
essities. Assuming that after having com-
ed satisfactorily the three years' work in
senior course, the student desired to proceed
the advanced course, he was allowed still
her scope for specialisation, as shown by
following outline of syllabus:—(1) Central
jects such as: Building construction,
ders' quantities, structural work, carpentry
joinery.

2) Allied subjects including: Building
hematics, practical geometry, surveying and
lling, building equipment including practical
tation, building supervision, architectural
building history.

here was a Practice Class to enable students
work out in greater detail and to apply to
gn the principles taught in the lecture class.
students' work in this class must be sub-
ed for inspection at the end of the session;
of the work might, therefore, be in the
re of "testimonies of study," the items
g selected from the syllabus of the central
ect. The work done need not be restricted
rawing.

rom this scheme, which was in full working
r in some districts, it would be seen that
aching syllabus covering practically the
le range of building construction might be
ved. It was desirable, in fact necessary,
ve examinations at the end of each session's
. The examination papers were not
ssarily prepared by the committee who had prepared the syllabus, but rather by examiners who were selected because they possessed special knowledge of the various subjects of the course. The school records of these successes were kept, and it would produce less confusion if certificates were granted only at the completion of (1) a trades' course; (2) a third year senior course; (3) at the end of the advanced course.

The Board of Education now endorsed certificates issued after a completed satisfactory three years' senior course.

In conclusion, Mr. Riley said he hoped that such meetings as the present one would result in a great educational advancement of the young people engaged in the building industry.

A FOREMAN'S AUTHORITY TO ESTIMATE

A question of a manager's authority to estimate for painting work was decided in the Bow County Court recently, before Judge Snagge. The plaintiffs were Messrs. J. P. Luton & Son, master painters and decorators, of 14, Forest-lane, Stratford, and they sued Mr. Thos. Holmes, of 20, Plashet-grove, East Ham, confectioner and tobacconist, to recover £44 11s. 9d. for painting work done.

Mr. Frank White appeared for the plaintiffs; and the defendant in person, and he admitted £30, declaring that there was a verbal estimate for the whole of the painting for that amount.

Mr. Joseph Thos. Luton denied that there was any agreement to do it for £30, and declared there was no estimate. No workman had authority to estimate.

The defendant said he was opening a confectionery and tobacconist business, and he asked for a foreman to come down and give a price for painting and fitting up the shop. The man duly came, and measured up, left to say he would go and work it out, and the next day called and said it would be £25–£30. The defendant told him to get on with the job. At that time the plaintiffs were not very busy, but directly after they started defendant's work they had a big rush of work, with the result that the men were kept working at overtime rates until 8 o'clock at night. That very much increased the cost of the job, but it had nothing to do with the defendant.

Replying to questions the plaintiff said that defendant was told they were too busy in the office to give an estimate, but they would go on with the work and do it as cheaply as possible. The shop was painted throughout, also the windows and the shop front.

Judge Snagge said the only question was whether there had been an estimate or not. It was true the foreman might have thought it might have been £30, but it should have been in writing. The plaintiffs say that the amount charged is fair and reasonable.

The foreman referred to denied that he gave any estimate, and said he had no authority to do so. He measured up the job, and then went back to get a price for it, but plaintiffs were so busy in the office that he was asked to go back and see if the defendant would agree to let them go straight on with the job, and do it as cheaply as possible. It was true that he was then asked what it was likely to come to, and he told the defendant "somewhere about £30," but that was only a rough guess, it was never intended as an estimate. Besides all this, the defendant increased his order by having the whole of the front of the shop painted, so that anyway it would have been more than £30. It was further stated that the plaintiffs agreed to take off £2 from their bill if the defendant would pay on the spot. The defendant's daughter gave the orders for the painting.

The defendant said that it was not always the case that the order was given to the firm direct. In this case he knew the foreman, and knew that he had worked for the firm for years, and was a trusted servant, therefore he had no hesitation in accepting his word that the cost would be £30. If the plaintiffs had made a mistake, and the work had actually cost them £35 to carry out, it had nothing to do with him; it was not by any means an unusual thing for a firm to lose on an order.

In giving judgment, Judge Snagge said that he had to find that no estimate had been given, but all the same he considered that the foreman had done a risky thing in suggesting a price without authority. He should give judgment for the plaintiffs for £44 11s. 6d., and costs.

HEATING OF HOUSES

Writing recently in the *Times*, Professor D. F. Harris said: "The opening up recently of several Roman dwellings in this country has brought vividly before some of us the lost art of heating a house.

"The Romans warmed their houses by the pleasantest and most scientific methods—namely, that of heating the floors of the rooms by means of hot air which passed continually below them. The hot air of the hypocaust, besides warming the floors of the rooms of these one-storied Roman villas, also heated the water for the bath. Mediæval Europe lost this art; it forgot how to heat houses and it neglected to provide baths. On the cold earthen floors of the gloomy castles rushes were spread presumably to keep the feet of the lords and ladies warm, for the fire in the vast chimney of the banqueting hall must have been a most inefficient heater of that great apartment. We all know that if our feet are warm we are warm, or, at least, comfortable all over, and that if the floors are warm all is well, calorifically speaking, with the house.

"The small 'open fire' of millions of small houses at the present day is an excellent ventilator, but a bad heater of the air of the room. The problem should always have been before the architect how to heat a room without neglecting to change its air—the essence of ventilation. The open grate is a wasteful and dirt-scattering source of domestic heat. When the building of houses is so much before the nation at the moment, it might be well to remember the efficient, clean, and healthy Roman methods of heating the floors first. I understand that our architects are indeed contemplating something of the kind, a return to the long-forgotten good old Roman system."

At a meeting of the R.I.B.A. on November 21, 1921, Mr. G. D. Widdows (School Architect to the Derbyshire County Council) mentioned this subject in a paper on "School Design," and said one of the things that became noticeable with the introduction of better ventilation was the inadequacy of the heating apparatus, usually low-pressure hot water, to be found in schools. They were usually put in with the guarantee by the engineer that a temperature of 60 degrees would be maintained when the outside air was freezing, but to obtain heat every door and window had to be kept shut. At North Wingfield the heating was by means of steam pipes under a concrete floor composed of slabs 2½ in. thick. By keeping the feet warm the blood circulated, and the admission of cool air striking the skin and filling the lungs acted as a tonic. No great heat was required on the floor surface. A temperature of 75 degrees was more than ample; and that, of course, was much less than the heat which reached one's feet when sitting in front of a fire. While steam had much to recommend it, he was not sure that hot water would not be better, as there was less mechanism to get out of order.

Sir G. Gilbert Scott, in the discussion that followed, said he had adopted a system of heating through concrete channels in the floor of Liverpool Cathedral. That system had the great advantage that where it was used people did not complain of cold feet, and the objection to cold stone or marble floors was removed. The hot air was circulated through channels in the floor, and the matter was really a reversion to the old Roman idea of hot-air heating.

In replying to some of the questions raised the lecturer said he was sure floor ventilation would be the system generally adopted in the future.

THE BUILDING TRADE DISPUTE

ALTHOUGH the deliberations between employers and operatives on Wednesday last week lasted for some time, they did not provide a definite decision. The joint committee, consisting of the disputes committees of the two sides, met later, and there was also a meeting of the Liverpool operatives and employers charged with the task of devising a plan by which a local complication could be lifted out of the way which was otherwise open to lead to a general settlement. The following joint statement was afterwards made by Mr. F. A. Wall, for the employers, and Mr. R. Coppock, for the men:—

"Joint negotiations were continued throughout to-day. The position of Liverpool was again discussed. The Liverpool operatives and employers met in conference to see if it was possible to provide a formula that would meet the position. Substantial progress was made and proposals were formulated for a settlement of the Liverpool dispute for the consideration of the National Joint Negotiating Committee. If an agreement on the position can be reached, the course is clear for full negotiations on the main issue, with a view to a national agreement."

As a result of a special combined meeting of the National Allied Building Employers' executives, members of regional and local disputes committees, and other members of the national allied bodies, over which Mr. W. H. Nicholls presided, the following official announcement was made:—

"A largely attended meeting of allied employers' executive councils, members of regional councils, and local disputes committees and members of the allied bodies was held to-day at King George's Hall, when the proceedings of the past week were reported on and lengthily discussed. It was announced that a formula had been arrived at with respect to the Liverpool difficulty for submission to the Liverpool operatives, who would give their decision by Thursday in next week. If that decision should be favourable it would pave the path to peace. In the meantime, the position continues to be one of delicacy."

At a meeting on Wednesday a joint meeting of the parties was held at the Ministry of Labour and adjourned until yesterday, when it was hoped that a settlement would be arrived at.

The result of this conference, held yesterday, is, of course, by now known, although too late for us to make any comment in this issue.

Builder's Estate.

Mr. Charles Edwin Banks (85), of Belmont Hill, Lee, S.E., retired builder (net personalty £7,508), £13,784.

Housing Scheme for Leicester.

A deputation from the Leicester Housing Committee recently visited the Ministry of Housing with a view to obtaining sanction to erect 1,000 houses on the Saffron-lane Estate, which will ultimately accommodate 2,500 houses. While in London the deputation also introduced the matter of developing a large estate on the west side of the city, where there is room for 5,000 dwellings.

A new kind of concrete building is being experimented with at Loughborough, Leicestershire. The concrete blocks are triangular and are laid so that the outer face of the wall is composed of impervious concrete, and the inner face of porous blocks, this being claimed to eliminate the evil of condensation from which ordinary concrete buildings suffer.

Unauthorised Subscriptions.

Architects are warned that subscriptions are being solicited in London by an unauthorised person for an American architectural publication, and they are advised to make careful enquiries before giving any orders in this way.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barrow-in-Furness	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barry	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bath	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/1
Bedford	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½

POSED THAMES-SIDE FACTORY

ncheon given by the Ford Motor Co. t the Hotel Metropole, Mr. H. S. anaging director of the Ford Motor and), Ltd., said this year marked e acquisition by the company of a te on the north bank of the Thames nam, Essex. At the time of the f the site it was the intention of the o proceed with building operations east possible delay, as it was anticithe present anomalous position with Ford cars created by the horse-power be made the subject of a proper . It was, of course, possible, he the development plan would be. to extent, dependent upon the trend of in this matter, but there was every that justice would be done and a s of taxation created.

enham site would probably be occuorks capable of employing 10,000 d of producing 500 cars per day. which was of a riverside character, on agricultural and partly on rend, and was ideal for its purpose. was well adapted to the construction ssary docks and wharfage, and the of the situation on the navigable Thames, in facilitating the intake as well as the export of the finished ere obvious. The railway ran e property, and there were excellent ll sides. Proximity to the great urces of the East End of London her considerable advantage.

ition of the McKenna duties, how- it an uncommercial proposition, so l cars were concerned, to manufacs country, but that did not neces- the company from continuing their to manufacture in Great Britain arge their manufactures here for r and for the Continent of Europe. of the development largely de- whether the payment for the le car was assisted by the altera- tax question. It was openly ad- the horse-power tax, as at present he Ford car, was unjust and in-

ins further stated that there were employees in the plant at Man- were not British, and that the ate paid was 3s. per hour, no matter ntary the duties. There was also rship or investment scheme whereby received a minimum interest of of deposits in the business up to their earnings. So far the actual d had averaged 14 per cent., and y employee had availed himself of Ford factories they found useful ind, deaf, crippled and deformed

of Public Lighting Engineers and Superintendents.

l Institute of British Architects has Ir. James Lochhead, F.R.I.B.A., of N.B., and Mr. G. A. Paterson, of Glasgow, to represent them at ning annual meeting of this Instiilasgow and Edinburgh, on Sep- 17 and 18 next.

New Hall for Hastings.

ster of Health has notified the wn Council that, as a result of the ry recently held into the proposal, ioned the erection of the proposed between White Rock Gardens and The cost will be approximately e pavilion, the construction of e at once commenced, will, when available for music, dancing, and oses.

TRADE NEWS

In connection with the developments and extensions of the London underground electric railways, Messrs. Waygood-Otis, Ltd., have fitted some new type escalators at the Bank station of the Central London Railway, and Moorgate-street station of the City and South London Railway. These escalators are designed to carry 8,000 passengers per hour in a continuous stream, and the advantage of this method of conveying a large number of people over the previous arrangement of lifts is shown in the rapidity with which the crowds leaving the trains are conveyed to the upper level. These machines are built with a width of about 4 ft. between the handrails, which move simultaneously with the steps. Messrs. Waygood-Otis have in hand sixteen similar escalators for the Underground Railway Company and eight for the Italian Railway, and have recently completed three for the Sydney Harbour Board.

We have received from Messrs. J. Wright & Co., a pamphlet describing their "Utility" blocks. The concrete block is composed of crushed ballast, sand and British Standard Portland cement, the mixture being thoroughly mixed and wetted before it is placed in the moulds. The blocks are made under pressure, which ensures a dense, non-porous block with clean, sharp arrises, and of great strength and durability; the proportions being made in accordance with the Ministry of Health's specification. In wall construction for dwellings the outside is constructed of ballast concrete blocks and the inside of breeze blocks, with an air cavity in between. By this method the wall is made absolutely weather proof, and condensation on the inner walls is eliminated owing to the porous breeze inner block and air cavity. It is claimed there is a great saving in the cost of constructing the walling with these blocks owing to the low cost of the blocks and the great saving in labour and materials.

The name of Doulton is so intimately associated with the architectural world that our readers will be interested in the admirably produced quarto which has just appeared, summarising the rise and expansion of the Royal Doulton Potteries during six reigns. Over a hundred years ago (in 1815) was modestly begun a small pottery by John Watts and John Doulton, in Vauxhall Walk, Lambeth, which has now developed into an important limited company, which, in 1901, received the authorisation to use the word "Royal." Lambeth, Burslem, Rowley Regis, and Paisley are now the homes of various branches of this great pottery industry. Of the large field covered by Doulton activities, the volume before us gives a good idea, and we may note that the making of ornamental pottery has been equalled in importance by the making of electrical and medical porcelain, as well as the well-known Carrara and other facing materials for buildings which Messrs. Doulton have so successfully developed.

The subject of ancient and modern building is graphically dealt with in a well-produced folio just published by Messrs. Holloway Bros. (London). The work is prefaced by some interesting illustrations of the earliest forms of building, and when one looks over the list of new buildings which Messrs. Holloway Bros. have carried out under many of our most distinguished architects, we may certainly be ready to accord the firm a prominent and noteworthy place in modern building activities. Such buildings as the new General Post Office, the new Government buildings in Great George-street and Whitehall, Messrs. Whiteley's great stores, the United Universities Club, Caxton House, and Magnet House, Kingsway, give some idea of this firm's extensive operations, to say nothing of town and country houses, restorations of old buildings, and more recently large engineering works. The capacity, energy and enterprise which have made possible the creation of such a sound business are amongst the really valuable assets of this country, and no reasonable person should begrudge an ample reward to those who unite business capacity and rectitude to such results as this volume before us indicates.

PATENTS

APPLICATIONS PUBLISHED.*

212,152.—M. R. Hutchison: Construction of insect-proof door and window openings.
212,156.—R. Partridge and J. Westwood & Co., Ltd.: Metal shelves.
212,165.—J. McArthur: Door locks.
212,188.—Building Accessories & Flooring Co., Ltd., H. Goodwin and H. Smith: Manufacture of asphalt.
211,516.—D. Gardner: Paints, enamels, and japans.
211,517.—H. Andrews: Manufacture of Portland cement.
211,628.—J. M. Lander: Domestic fire-places and ranges.
211,647.—G. H. Martin: Gate and door fasteners.
211,650.—Chatwood Safe Co., Ltd., and H. S. Bruckshaw: Strong-rooms.
211,715.—A. Illidge, A. E. Illidge and C. A. Illidge: Sash fasteners.
197,933.—Chemische Werke Vorm. Auerges. Kommanditges: Method of rendering enamel opaque.
211,765.—G. Bennet: School desks.
211,774.—L. R. C. Ching: Heating and ventilating systems.
211,782.—C. E. Page, J. F. Page and C. N. Page: Flushing-cisterns.
209,715.—G. H. Larsson: Crushing-machines for stone.
210,793.—C. V. Hansen: Roofing plate.
212,986.—S. Vivian: Drying of china clay.
213,017.—W. F. Moody: Combination double frame to hold clothing, hats and umbrellas, for attachment to chairs and pews.
213,024.—K. L. and C. Weber: Process of making flexible non-breakable transparent and waterproof window panes.
213,062.—J. Lance: Window.
213,066.—Jackson Boilers, Ltd., and H. Hargreaves: Electrically-heated water-boiler.
213,067.—J. E. Noirit: Collapsible seat.
213,081.—A. B. Anderson: Domestic grate, range, &c.
213,090.—W. C. Strudwick: Chimney and ventilating-shaft top.
213,094.—A., A. E., and C. A. Illidge: Casement stays.
213,096.—Pontnewydd Tin Stamping Co., Ltd., and W. T. Horton: Metal hearth-plate.
213,103.—D. Cunningham: Painting and whitewashing machine.
213,106.—H. Spencer: Ventilator.
213,120.—H. Crowther: Fastening-device suitable for casement windows.
213,160.—F. A. Davey: Casement hinge.
213,176.—A. E. Tutty: fire-grate.
213,177.—G. Boshell, A. E. Clifford and A. J. Maker: Apparatus for polishing floors.
213,189.—G. E. Shoemaker: Water-heating apparatus.
213,200.—J. Lovell: Roofing-tiles.
210,074.—R. Oerley: Feet for articles of furniture.
214,013.—T. H. Youngs: Ball-valve tap.
214,339.—A. Wells and J. Stone & Co., Ltd.: Means for connecting service pipes to water and gas mains.
214,347.—H. Cuerden: Latch for doors.
214,365.—Showell & Sons, Ltd., and A. E. Johnson: Combined casement stays and fasteners.
214,369.—B. Bakewell: Manufacture of magnesite cement.
214,371.—W. J. Drain: Stone crushing or breaking machines.
214,392.—J. E. Beckett and Beckett, Laycock & Watkinson, Ltd.: Doors, and locks therefor.
214,394.—M. Hatton: Manufacture of coloured tiles, slabs or bricks.
214,403.—J. Winfield: Catches or fasteners for doors.
214,416.—J. Fowler & Co. (Leeds), Ltd., and D. Wood: Scarifiers for roads.
214,420.—F. H. Hall: Windows.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

AUGUST 22.—**Pembrokeshire.**—VARIOUS.—For carrying out for the County Small Holdings Committee (1) alterations, repairs to house at Milton Farm, Berton; (2) alterations and repairs to existing house and outbuildings and erection of a house at Chapel Farm, Castlemartin: (3) alterations and repairs to outbuildings and erection of house at Cox Hill holding; (4) erection of new outbuildings at Bungalow Holding and Rose Cottage Holding, Trefwynt. Mr. O. T. Thomas, County Offices, Haverfordwest. Deposit £1 1s.

AUGUST 23.—**Bromley.**—BUILDINGS.—For the erection of a bowling pavilion, women's convenience, dressing-rooms, &c., on the Whitehall Recreation Ground, Bromley Common, for the T.C. Borough Engineer, Municipal Offices, Bromley. Deposit £1 1s.

AUGUST 23.—**Hove.**—PAINTING.—For painting the external wood and ironwork, and painting, distempering, &c., the interior of the Ward Blocks "A" and "C.D.," the Lodge, and Laundry Block, at the Hove Sanatorium, for the T.C. Borough Surveyor (Mr. H. H. Scott), Town Hall, Hove.

AUGUST 23.—**Londonderry.**—ADDITIONS.—For additional buildings at Hospital. Messrs. Robinson & Elliott, 7, Market Buildings, Londonderry. Deposit £2 2s.

AUGUST 23.—**Poole.**—HOUSES.—For the erection of 10 houses, with drains, fences, &c., at Granville-road, Upper Parkstone, for the T.C. Borough Surveyor, Municipal Offices, Poole.

AUGUST 23.—**Ystrad (Rhondda).**—PAINTING.—For painting and decorating the interior of Ystrad Library. Evan Edwards, Library, Ystrad (Rhondda).

AUGUST 25.—**Aylesbury.**—COTTAGES.—For erection of 36 cottages in four contracts, for the T.C. Mr. Wm. H. Taylor, Borough Engineer, Town Hall, Aylesbury.

AUGUST 25.—**Bradford.**—SANITARY.—For the conversion of six privies into water-closets at 83 to 93, Grantham-road, for the T.C. Chief Inspector, Sanitary Department, Town Hall, Bradford.

AUGUST 25.—**Dublin.**—PAINTING.—For painting work at Crooksling Sanatorium, Brittas, co. Dublin. Mr. John J. Murphy, Town Clerk, Dublin.

AUGUST 25.—**Dunfermline.**—FENCING.—For the supply and erection of about 1,200 lineal yards of stob and wire fencing in connection with the widening at Halbeath-road, for the T.C. Burgh Engineer, City Chambers, Dunfermline.

★AUGUST 25.—**Guildford.**—WAR DEPARTMENT CONTRACT.—Artificers' Works Contract, from September 17, 1924. Tenders are required for the undermentioned station and division in the Woolwich Royal Engineer District. Contract 3, Guildford.—Commanding Royal Engineer, or in person, between the hours of 10 a.m. and 3 p.m. o'clock, Royal Engineer Office, New-road, Woolwich, S.E. 18.

AUGUST 25.—**Hemsworth.**—EXTENSION.—For extensions to secondary school, for the West Riding E.C. Education Dept., County Hall, Wakefield.

AUGUST 25.—**Hertfordshire.** — COUNTY SCHOOL.—Erection and completion of a new County Council School, to accommodate 120 scholars, at Hunsdon, near Stanstead Abbots, for the Hertfordshire C.C. County Surveyor's Office, Hatfield, between the hours of 10 a.m. and 4 p.m., except on Saturdays. Deposit £1 1s.

AUGUST 25.—**Kingston-on-Thames.**—BUNKER.—For construction of coal bunker at the Hospital, for the Board of Guardians. Mr. W. Taylor, Clerk, Kingston-on-Thames.

AUGUST 25.—**Leeds.**—PAINTING.—For painting at Corn Exchange and polishing of Market Hall shops, and painting of exteriors of houses on the Harehills, Barkley, Middleton, Wyther, and Hawksworth Wood housing estates. Mr. W. T. Lancashire, City Engineer, Leeds.

AUGUST 25.—**Lisburn.**—HOUSES.—For the erection of 10 houses on Hillsborough Old-road, for the U.D.C. Surveyor, Town Hall, Lisburn.

AUGUST 25.—**Liverpool.**—PAINTING.—For painting and general repairs at Westminster-road Police and Fire Stations, for the T.C. Land Steward and Surveyor, Municipal-buildings, Liverpool.

AUGUST 25.—**Manchester.**—OFFICE.—For the erection of a tramway office, Stockport-road, Levenshulme, for the T.C. City Architect, Town Hall. Deposit £1 1s.

AUGUST 25.—**Morley.**—HOUSES.—For the erection of 48 houses and for the several other works in connection therewith on the Middleton-road Housing Estate, for the T.C. Mr. F. Turner, Borough Engineer, Town Hall, Morley. Deposit £1 1s.

AUGUST 25.—**Ogmore Valley.**—PAINTING, &C.—For the painting, decorating, and repairs to the Workmen's Hall, Institute, and Caretakers' Apartments at Ogmore Vale. Mr. W. T. Springall, Lic.R.I.B.A., Architect's Department, Co-operative Wholesale Society, Ltd., St. Mary-street, Cardiff.

AUGUST 25.—**Pontypridd.**—BUILDINGS.—For the erection of (a) battery room, (b) blacksmith's shop, at Treforest Depot, for the U.D.C. Surveyor, Municipal Buildings, Pontypridd. Deposit £1 1s.

AUGUST 25.—**South Shields.**—ALTERATIONS, &C.—(1) Supply of steel and iron work; (2) erection of steel and iron work, and alterations to existing building, in connection with the construction of balconies and stairways at Cleadon Park Sanatorium, for the T.C. Mr. S. G. Stanton, Borough Engineer, Town Hall, South Shields. Deposit £1 1s.

AUGUST 25.—**Stoke-on-Trent.**—WALL.—For the building of a retaining wall for coal stores at the Etruria Gasworks, for the T.C. Chief Engineer, Gasworks, Etruria, Stoke-on-Trent.

GLAMORGAN.—The Council, in conjunction with the Glyncorrwg U.D.C., proposes to construct a new road

* List of Contracts, Competitions, etc.

from Caerau to Duffryn Rhondda.—The M.H. has held a public inquiry into the application of the Port Talbot B.C. to borrow £1,489 for the drainage of the Aberaven Moors. The total cost of the scheme is £4,390, Ministry and landowners' grants making up the cost above the sum to be borrowed by the Council. The Council will, upon completion of the scheme, erect houses on the moors.—The Aberdare U.D.C. is considering alternative sites available for the erection of a maternity home.—The Merthyr Tydfil B.C. architect has reported the suitability of the Troedyrhiw Halt site for the erection of 72 houses by the Council. A sewer will be necessitated along the Cwmdu-Glantaff-road and a roadway will probably be constructed in the old canal bed.— The Merthyr Tydfil B.C. has now decided to erect a single-story building as a public library, at an estimated cost of £5,000, and has called for plans to be prepared.

GLASGOW.—The Housing Committee of the T.C. are considering a scheme for the acquisition of 50 acres of land on the Govanhill Estate, suitable for a housing scheme.

GOSPORT.—Plans passed by T.C.: Pavilion, Anglesea-road, for Gosport and Alverstoke Tennis Club; house, Testcombe-road, for Mr. J. W. Mabbs; house, Privett-road, for Mr. A. D. Bradford; two villas, Angleseyroad, for Messrs. Northcott & Pile; house, Crescent-road, for Lieut.-Col. Lewin.—The T.C. has considered alternate plans prepared by the B.E. showing the lay-out of the esplanade adjoining the landing stage and approved that showing the approach to the landing stage laid out as a boulevard with public conveniences. The B.E. has been asked to prepare a lay-out for the esplanade at Gosport Hard.

GRAVESEND.—The Town Clerk has prepared a report emphasising the need for the provision of isolation hospital accommodation, and has been authorised to communicate with neighbouring authorities with a view to a joint arrangement.—In connection with the proposed development of the Wrotham-road estate, the roadway is to be widened.—The Surveyor has prepared a lay-out of land at Clarence-place and been asked to submit an estimate of the cost.—The Housing Committee has interviewed Mr. Clements and arranged terms for the construction of 24 houses—Plans passed: House, Cross-lane East, for Mr. W. J. Holland; four houses, Northcote-road, for Mr. W. Andrews; four houses, Portland-avenue, for Mr. W. H. Black; house, King's-drive, for Mr. A. S. Gates; two houses, Singlewell-road, for Mr. W. J. Holland; bungalow, Whitehall-road, for Mrs. Kent.

HALE.—At a meeting of the U.D.C. the conveyance was sealed of a house, 82, Cecil-road, with land and premises, for the purpose of a fire and ambulance station.

HALSTEAD.—Plans passed by R.D.C.: Bungalow, Sible Hedingham, P. Parr, for F. Mead; pair of cottages, Earl's Colne, P. J. Westwood, for Miss Stange.

HARWICH.—The T.C. has decided to borrow £1,030 for widening Oakley-road and the pathway near Parkeston-road.—School playgrounds are to be tar-paved at a cost of £902.

HASTINGS.—The M.H. has notified the T.C. that, as a result of the official inquiry recently held into the proposal, he has sanctioned the erection of the proposed new pavilion between White Rock Gardens and the parade. The cost will be £12,000.——The M.H. has held an inquiry into the application of the Corporation for sanction to borrow the sum of £1,500 for purposes of water supply.

HEBBURN.—The M.H. has sanctioned the borrowing of £4,060 for the purpose of erecting an additional 11 houses.

HEMSWORTH.—Plans passed by R.D.C.: 166 houses at South Elmsall, for the R.D.C.; bungalow at Common End, South Elmsall, for Mr. C. Taylor; house at South Elmsall, for the United Services Club of the Carlton Main Colliery Co.; estate at Back-lane, South Elmsall, for Messrs. J. Hinchliffe & Son.

HEREFORD.—The C.C. has acquired a site at Portfields upon which they propose to erect 18 parlour type houses and 38 non-parlour type houses.—The Butter Market, recently damaged by fire, is to be reconstructed at an estimated cost of £3,000.

HOLYWOOD HALL.—The M.H. has sanctioned the proposal of the Durham C.C. to provide additional water storage at the sanatorium, at a cost of about £1,400.

HORBURY.—Plans passed: Two shops in High-street, for Mr. G. Chappell.

ILFRACOMBE.—Plans have been approved for the lay-out of the recently-acquired land in Church-street by the U.D.C. This is to be the site of the local war memorial.

IRLAM.—Lancashire E.C. proposes the purchase of Longfield Lodge for use as a school clinic, at a cost of £1,800.

KIRKHAM.—Plans for the erection of four houses in Swarbrick-street, two in Ribby-street, one in Station-road, and one in Freckleton-street, were passed.

LEATHERHEAD.—The Surrey C.C. has decided to proceed with the widening of the London–Epsom main road in Leatherhead, at a cost of £10,030.

LEICESTER.—As a result of the visit of a deputation of the Leicester Housing Committee to the Ministry of Health, sanction was obtained for the building of an additional 500 houses.

LEIGH.—The T.C. approved a recommendation of the Housing Committee to acquire for £775 five acres of land belonging to the Leigh Football Club, between the canal and football ground, for the erection of 60 houses, at a cost of £30,375.

LINTHWAITE.—The M.H. has sanctioned a loan of £8,650, for the purpose of erecting 16 houses at Cowlersley.

LITTLE HOLLAND, NEAR CLACTON-ON-SEA.—The construction of a hard tennis court is proposed. It is not necessary that this should be one of the patent varieties, but any suggestions would be considered. Firms wishing to entertain the matter should communicate by letter to the Secretary, c/o The Post Office, Little Holland, near Clacton-on-Sea.

LITTLE HULTON.—Sanction is being sought for a loan of £18,600, for the erection and equipment of a Council school.

LONGTON.—A loan of £1,500 is being sought by the Lancashire E.C. for additional cost in respect of the erection of a Council school. Sanction to a loan of £7,700 has been granted, but the lowest tender exceeds this amount by £1,364.

MALLING.—Plans passed by R.D.C.: Addition to house at Ightham, for Mr. F. A. Nisbett; cowshed at Ryarsh, Mr. F. Brooks; bungalow at Pilgrim-road, Trottiscliffe, Mr. W. J. Green; at Thrift Wood, Stansted, Mr. S. Parrette; bungalow at Hale-street, East Peckham, Mr. J. W Horsley.

MARKET HARBOROUGH.—The M.H. has sanctioned a loan of £200 for a new sewer on the Kettering-road.—Plans passed by U.D.C.: House, Great Bowden-road, for Mr. J. Wilkins; bungalow, Knoll-street, for Miss Ginns.

MARPLE.—Cheshire E.C. is purchasing a site at a cost of £600 for a new school.

MERTON.—The U.D.C. has decided to widen Mostyn-road at a cost of £1,983, and Long Lodge at a cost of £2,264.

MITCHAM.—The U.D.C. has prepared a scheme for the reconstruction of the railway bridge at Streatham-road, estimated to cost £9,000.

MIDSOMER NORTON.—Plans passed by U.D.C. include a new Primitive Methodist chapel at Welton; and a pair of houses in North-road.

MORETON.—Cheshire E.C. is seeking sanction for a loan of £14,000 for the erection of a school.

MORPETH.—The T.C. has decided to erect seven houses at West Green, at an estimated cost of £3,000.

NELSON.—At the T.C. it was decided to proceed with the erection of 50 additional houses on the Marsden Park site and a sub-committee was appointed to consider the lay-out and type of houses most suitable. The following plans were recommended for approval: For Bankfield Mill Co., extensions to warehouse, Vulcan-street; for Messrs. Haworth, Ltd., workshop, back Edward-street; for Mrs. Adams, dairy and garage, Thomas-street. It was resolved that the Borough Surveyor and Cleansing Superintendent make inquiries and submit estimates of the cost of erecting conveniences in the following positions:—Carr-road Recreation Ground; Carr-road and Arundell-street; Brunswick-street Recreation Ground; Brunswick-street and Napier-street; corner of Netherfield-road and Roberts-road; junction of Hildrop-road with Bradley Hall-road; also the provision of conveniences in the section of Walverden Ward, and that the Surveyor report on suggested alterations to the conveniences in Manchester-road. The Marsden Building Society have secured premises adjoining their head office in Scotland-road, which they propose to adapt as an extension for their office requirements.

NEWPORT (MON.).—The Watch Committee is considering a scheme for the erection of six houses now and six later on land at the rear of Maindee station, for the accommodation of members of the Force.—The Works Committee has decided that henceforth every house erected must have separate drainage.—The English Homesteads, Ltd., have taken the frontage of the widened Barrack-road between the hospital and the barracks for building purposes.—A new road is suggested from Chepstow-road to Liswerry-road.—The M.H. has sanctioned a loan of £5,000 for the reconstruction of Dock-street.—The T.C. has accepted the offer of Lord Tredegar to present the town with the castle buildings and land on condition that the Corporation spends £5,000 under proper archæological direction in putting the old castle in some sort of decent repair.—Negotiations are to be continued with the G.W.R. for the acquisition of a portion of the Monmouthshire Canal from Barrack-hill to the Town Dock with a view to its closure and conversion into a road.—The M.T. has promised a grant of 65 per cent. of the cost of the reconstruction of Newport Bridge, for which the Corporation has accepted the tender of Sir William Arrol & Co. of £140,275. The Corporation has now definitely decided to have the facing work of the bridge carried out in stone.—The Town Clerk, Borough Treasurer and Borough Engineer are preparing a report as to sites suggested for the proposed new town hall.—Messrs. J. W. Holmes & Co. have prepared plans for the development of the Ladyhill Estate.—Part of the housing site at Maindee Park is to be laid out as a recreation ground.—The E.C. proposes to establish a central school at Hatherleigh and a temporary school with accommodation for 200 at Somerton.—Extension to stores, Chepstow-road, for Messrs. Swallwell & Havard.——Plans passed by T.C.: Edward VII-crescent, three houses, J. Mathias & Sons; St. Julian-road, two houses, Jones & Lewis, for Meaker Bros.; Summerhill-avenue, house, Graham Hitchcox & Co., for R. G. B. Stokes; Keynsham-avenue, two houses, A. E. Sheppard, for T. J. Hill, Rutland-place; Keynsham-avenue, four houses, A. E. Sheppard, for T. J. Hill; Hawarden-road, two houses, Henry Budgen & Co., for J. Thomas & Co.; Rodney-road, offices and garage, W. J. Davies, for Henry Richards & Co., Ltd.; Barrack-lane, house, English Homesteads, for Mrs. S. Williams; Barrack-lane, house, English Homesteads Co., for A. E. Hannah; Allt-yr-yn-avenue, six houses, C. E. Tebbs, for H. J. Herbert & Co.; Commercial-street, six shops and 12 flats, Page & Lawrence, for Jacobs & Phillips.

NOTTINGHAM.—The contract for the new Midland Palais de Dance, to be erected at the junction of King Edward-street and Parliament-street, Nottingham, has been secured by Messrs. W. & J. Simons, Nottingham, and excavation work is to be put in hand at once. The architects are Messrs. Alfred J. Thraves, M.A., and H. Hardwick Dawson, L.S.A., High-street, Nottingham.

OKEHAMPTON.—The town will benefit greatly by the will of Mr. Sidney Simmons. Some years ago Mr. Simmons purchased Okehampton Castle, which he restored and endowed, and this, by his will, he leaves to the town, in addition to £10,000 for a town reading room, and literary institution; and £5,000 for almshouses.

OUGHTIBRIDGE.—The Wortley Rural Council have decided to erect 20 houses for Oughtibridge, but this number is much below the requirements—200 houses are to be pressed for.

OXENDON.—The R.D.C. has approved of a scheme for a joint hospital scheme for infectious cases for Kettering.—Plans passed for houses in East Farndon.

PAIGNTON.—The Surveyor has been instructed to prepare a scheme for a garage for the Council's vehicles. Mr. A. H. Eggins has been appointed architect for the purpose of advising on a suitable site. Preston for housing and the lay-out of sites.—Plans passed: New roads at back of Torquay-road, for the Paignton and District Development Co.; house, Barcombe Heights, for Mr. P. Maltby; house, Goodrington-lane, for Messrs. C. & R. E. Pile; house, Dartmouth-road, for Mr. A. Rowe; house, Goodrington-lane, for Miss Pile.

RADCLIFFE.—Agreement has been reached between the D.C. and the Clifton and Kearsley Coal Co. for the erection of houses on land off Outwood. The whole area for the land proposed to be developed contains about 26 acres, of which about 10½ acres will be developed by the Clifton and Kearsley Coal Co., and the remaining 15½ acres by the Council. On the latter provision is made for 182 houses.

RAWDON.—The U.D.C. has received sanction from the M.H. for permission to erect 25 houses. The proposed houses are estimated to cost about £6

REASEHEATH.—Cheshire C.C. has obtained leave to borrow £7,000 for equipping and furnishing the Institute.

RHONDDA.—Plans have been prepared for a new hospital to be erected at Llethrddu Farm site.—The Porth and District General Hospital Committee. The plans have been approved and embody a hospital with 176 beds, a fully-equipped school for nurses, &c., and staff living accommodation at an estimated total cost, with equipment, of £

RICHMOND.—The T.C. have passed plans for the erection of two semi-detached villas and two houses.

RUGELEY.—Alterations to Station Hotel.

SANDBACH.—The Improvements Committee recommend the Council to apply for assistance from the Unemployment Grants Committee towards the cost of extending the sewer on Coal Moss Heath, Back Smithfield-lane, and Middlewich-road to the boundary of East Elworth; the estimated cost of the scheme is £3,800.

SANDWICH.—Plans passed by T.C.: Hallett, eight houses in St. George's-road; World's End, for alterations to premises in King-street; Mr. Cloke, addition to offices, Strand-street.

SHEFFIELD.—Sanction has been given to the lay-out of street and road widening which will involve a cost of £375,000. Twenty-four roads or streets will be dealt with, which number constitutes the largest street scheme in Sheffield for some years. One of the roads to be widened is the main road out of the city to Worksop, Retford, and Lincoln.

SHELF (YORKS).—The Economic Stores, Halifax, propose to erect a model abattoir at Giles Farm, Shelf.

SHIPLEY.—The U.D.C. propose to adopt a scheme whereby they will erect over 100 houses of the working-class type, at an estimated cost of £300 and £400 each, in the Hurst Wood locality.

SILSDEN.—The M.H. has sanctioned loans of £1,000 and £1,050 for housing purposes.

SLEAFORD.—The U.D.C. has purchased land for housing scheme.—Plans have been prepared for alterations and additions at the cemetery.—Plans passed: Bungalow, Alexandra-road, for Messrs. Banks & Son; house, Drone-lane, for Mr. H.

SOWERBY BRIDGE.—Bolton Brow Wesleyan Chapel is to be renovated and a new minister's vestry built; also the choir vestry is to be extended at an estimated cost of over £500.

STANLEY.—Plans passed by the U.D.C.: four houses, Windermere-terrace, South Moor Colliery Co., Ltd.; house at Old South Moor, for G. Lee.—The Council have agreed to purchase 126½ acres of land at South Stanley for housing purposes, at a cost of £7,590, subject to approval of the M.H.

SOUTHEND-ON-SEA.—Plans passed: Two houses, Inverness-avenue, W. Carrington; conversion of house into flats, 28, Satanita-road, M. E. Pledge; conversion of house into flats, 47, King's-road, Cooper; house, Cricketfield-grove, H. Soulsby; bungalow and two houses, Bailey-road, J. Brush; bungalow and garage, Colbert-avenue, J. Mordecai; house, Surbiton-avenue, A. E. Whistler; three houses, Shorefield-gardens, H. W. Lake; nine houses, Bourne-grove, Burrill Bros.; two houses, Leigh-avenue, J. Wood; four houses, Leigh-gardens, Morris; three houses and shops, London-road, Martin; three bungalows, Pavilion-drive, Bros.; chapel, East-street, Prittlewell. W. conversion of house into flats, West-road; house and garage, Drake-road, Mrs. R. Hart; houses, King's-road, Tomkins & Smith; Great Eastern-avenue, W. J. Tibbles; house, avenue, E. D. James; conversion of house, 57, Warrior-square, F. C. Robinson; alterations, London-road, J. Outing; conversion of flats, 15, Grosvenor-road, Mrs. Hope; addition, Chalkwell Park-drive, R. Roach; house, Pall Mall, F. Hosking; house and garage, road, W. J. Robinson; alterations, Londo

o houses, Woodcote-road, H. Smith

ON.—Plans for the county school for
en amended as a result of certain sug-
he governors and the estimated cost is
commodation is to be provided for 400.—
to the Beddington and Wallington
prepare drawings for the enlargement of
ridge at Wallington Station.

WALLSEND.—A Miners' Welfare Scheme, to comprise an institute, is to be erected in Station-road. Plans have been prepared by Messrs. Caws, Street & Caws, of Sunderland. The building will comprise a large hall, library, reading room, a recreation room, and a caretaker's house. The plans have been approved by the T.C.

WARWICKSHIRE.—A further sum of £6,500 has been allocated for land drainage schemes.

WESHAM.—At a meeting of the Fylde D.C. it was reported that arrangements had been made for the carrying out of the work in connection with Bank-road, Marton. Plans for the erection of 33 new houses in the Fylde rural area were passed.

WEST BRIDGFORD.—Plans have been prepared by the Surveyor for a convenience at Lady Bay bridge.—Plans passed: House, Davies-road, for Mr. H. F. Smart; two houses, Loughborough-road, for Mr. A. W. King; house, Holme-road, for Mr. A. Reynolds.

WHITLEY BAY AND MONKSEATON.—In connection with its housing scheme at Hotspur-avenue, the U.D.C. is to invite tenders for the erection of twenty-five houses on the south-east side of the Avenue.

WOKING.—The Council proposes to drain the Horsell-rise Estate, as building development is being retarded owing to the want of main drainage.—Plans passed: Four houses, Wilfred-street, for Messrs. Childs & Shee; house, College-lane, for Messrs. Childs & Shee; house, Triggs-lane, for Mr. C. Mutter; house, Loop-road, for Major Fletcher; three houses, Blanchard's Hall, for the Duke of Sutherland; house, Viggory-lane, for Mr. K. Brumfitt; house, Church-road, for Mr. C. E. Robson; bungalow, Mayford-road, for Mrs. Scudamore; house, Smart's Heath-road, for Miss Tuck; cottage, Smart's Heath-road, for Mr. J. Mersh; two houses, Bagshot-road, for Mr. B. B. Barnes; bungalow, Smart's Heath, for Mr. W. Mersh; two cottages, Russell-road, for Messrs. Ryder.

WOODMANSTERNE.—The Parish Council is purchasing three acres of land, at £547, for a recreation ground.

Fires.

CLECKHEATON.—A fire has occurred at the engineering works of Geo. Crossley, Ltd.

LIVERPOOL.—A serious fire has occurred at premises belonging to Messrs. John Mathews & Co., varnish, paint and colour manufacturers, in the Vauxhall-road area of the city.

LLANIDLOES.—The Caenycoed (Llanidloes) blanket-making factory was destroyed by fire last week.

READING.—A fire took place recently at the factory of Messrs. S. & E. Collier, brick and tile merchants, at Reading. Damage to the extent of £12,000 was caused.

RENT RESTRICTION

NOTICES OF INCREASE AS NOTICE TO QUIT

A DECISION has been given by a Divisional Court in the case Aston *v.* Smith which is of importance under the Rent Acts. The plaintiff was the landlord of premises let to the defendant on a weekly tenancy and which had been so let to the defendant for some years. On August 21, 1923, the plaintiff gave the defendant notice to quit and issued a summons claiming possession of the premises. This notice to quit was held bad by the County Court Judge for reasons not stated in the report, but it had been contended before him that even if the notice was bad this was immaterial in this case as a notice of increase of rent had been given the defendant on May 3, 1920, and under section 1 subsection (1) of the Notices of Increase Act, 1923, this notice of increase operated also as a notice to quit and rendered the defendant a "statutory tenant," and a statutory tenant by the proviso to section 15 subsection (1) of the principal Act, 1920, was not entitled to a notice to quit.

The proviso in question to section 15, which relates to "Conditions of statutory tenancy," reads: "Provided that notwithstanding anything in the contract of tenancy, a landlord who obtains an order or judgment for the recovery of possession of the dwelling house or for the ejectment of a tenant retaining possession as aforesaid shall not be required to give any notice to quit to the tenant." The County Court Judge had given judgment for the defendant, but the Divisional Court reversed this judgment, holding that under the Notices of Increase Act, 1923, the notice of increase given in 1920 was also a notice to quit and rendered the tenant a statutory tenant, and under the proviso set out above the statutory tenant was not entitled to a notice to quit.

The Notices of Increase Act, 1923, provides in section 1 subsection (1), "Where notice of intention to increase rent has, whether before or after the passing of this Act, been served on a tenant in conformity with subsection (2) of section 3 of the principal Act, and a notice to terminate the tenancy was necessary in order to make such increase effective, the notice of intention to increase the rent shall have effect, and shall be deemed always to have had effect, as if it were or had been also a notice to terminate the existing tenancy on the day immediately preceding the day as from which the increase is, or was first to take effect, or on the earliest day thereafter on which, if it had been a notice to terminate the tenancy, it would have been effective for that purpose, and in the latter case a notice of increase served before the passing of this Act shall be deemed to have had effect as if such earliest date had been specified in the notice as the date from which the increase was to take effect."

From the above decision it appears that every tenant who at any time has had a notice of increase served upon him is, since the passing of the Notices of Increase Act, a statutory tenant, and as such not entitled to a fresh notice to quit, and this appears a somewhat serious proposition, and creates a position which may not have been contemplated by the Legislature.

At one time it was held, in the case Hartell *v.* Blackler (1920 2 K.B. 161; *The Builder*, July 30, 1920), that the receipt of rent would operate as a waiver of a notice to quit, but in Davies *v.* Bristowe, 1920 (3 K.B. 428; *The Builder*, August 26, 1921), and in Shuter *v.* Hersch (1922, 1 K.B. 438, *The Builder*, July 28, 1922), this case was not followed, and it was held that it was not necessary to give a statutory tenant a fresh notice to quit with every notice of increase unless a fresh tenancy had been created.

In none of these cases was a satisfactory interpretation able to be given by the Courts of section 16 subsection (3) of the Act of 1920, which is as follows, "Where the landlord of any dwelling house to which this Act applies has served a notice to quit on a tenant, the acceptance of rent by the landlord for a period of not exceeding three months from the expiration of the notice to quit shall not be deemed to prejudice any right to the possession of such premises."

In Shuter *v.* Hersch this subsection was considered, and the Court held that the receipt of rent for more than three months did not necessarily create a new tenancy, and it was suggested that this subsection had only been inserted in the Act because at the time when the Act was passed Hartell *v.* Blackler was still law, and the Legislature intended therefore to prevent waiver from operating for three months.

The cases decided after Hartell *v.* Blackler proceeded on the ground that since a landlord could not get rid of a statutory tenant it was unreasonable to hold that the receipt of rent in such circumstances by a person who was not a free agent could operate as waiver, but with the passing of the Notices of Increase Act, as illustrated by the case we are considering, new circumstances appear to have arisen if notices of increase in rent given at any time and acted upon for long periods are to have the effect of notices to quit.

Tenants who have complied with notices of increase and have paid such increase possibly for many years are hardly in the position of the ordinary statutory tenant under notice to quit, and we think should be entitled to a notice to quit before proceedings are taken.

In the case we are considering this subsection does not appear to have been brought to the notice of the Court, and we venture to submit that in the new conditions imported by the Notices of Increase Act it appears to meet the case, especially in connection with weekly or short period tenancies, and that the receipt of rent for a period exceeding three months should be taken as creating a new tenancy, and before proceedings for possession can be taken a fresh notice to quit should be given.

RICKET MATCH

tribute to the reputation of the orts Club (the Cement Marketing that when Mr. P. G. H. Fender to play them on their own ground ook on August 14 he took prac- whole of the Surrey County first it is not surprising, therefore, ortland eleven were beaten by a 220 runs. However, an excellent was enjoyed, and the match showed ortland team has some very pro- bers. It was no mean feat, for capture six of the best Surrey ten runs apiece, as did Mr. S. K. take the wickets of Sandham and having only 36 runs scored off during the match, a feat achieved rcroft.

ing are the scores :—

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Greenock.—HOUSES.—The Corporation Housing Committee has recommended that an additional 250 houses be erected under the slum clearance scheme. It had been decided already to construct 400 houses.—The Renfrewshire E.A. has agreed to the recommendation by the Property Committee in connection with the proposed new school, that consideration be given to the matter of providing swimming for pupils. It was agreed that the matter be kept in view by architects when submitting designs.—The question of providing additional accommodation at Greenock Academy has been remitted to a special sub-committee.

Oban.—VILLA.—The Dean of Guild Court has passed plans for a villa on land adjoining the applicant's house. The application was lodged by Mr. J. D. McTaggart, Portlea.

Stevenston.—HOUSES.—At a meeting of the Northern District Committee of Ayrshire C.C., plans were passed for a housing scheme, comprising 10 blocks of four-flatted houses.

Falkirk.—VILLA.—The Dean of Guild Court has passed plans for a villa at Camelon-road, for Mr. J. Wright, at an estimated cost of £1,500.

Dundee.—EXTENSION.—At the enquiry of the Dundee Gas and Water Provisional Order, which was resumed, consideration was given to a proposal by the Corporation to obtain authority to exchange four acres of the public bleaching green for a like portion of the grounds of Dudhope Gouse, the object being to make possible the extension of the Royal Infirmary. The Corporation states that the Board of Health has approved of the site of Loons-road scheme, under which 216 houses are to be erected.

Glasgow.—HOUSING.—The Finance Committee has recommended the Corporation to apply to the Scottish Board of Health for authority to borrow an additional £3,000,000 for housing purposes. The Housing Committee has recommended that tenders be obtained for the erection of club-houses at the bowling greens at Mosspark, Drumoyne and Riddrie.

Kirkintilloch.—HOUSES.—Plans for the erection of the first portion of the slum clearing housing scheme have been approved by the T.C. The Council proposes to build 100 houses.

Hamilton.—HALL.—The Dean of Guild Court has passed plans for a town hall, which is to adjoin the Municipal Offices in Cadzow-street. The building will have a hall to accommodate 1,750 people, and a lesser hall underneath to seat between 500 and 600.

Kilmarnock.—The T.C. has agreed to purchase the property known as Galahill, for the purpose of establishing a girls' hostel.

Aberdeen.—The Corporation passed plans for five houses and alterations to buildings, at a total cost of £6,410.

London Housing Schemes.

London Housing accounts for 1923–24, presented at a recent meeting of the County Council, showed a total expenditure on revenue account of £1,669,513, and an aggregate income of £966,697, giving a net deficiency of £702,816.

In the case of non-assisted schemes (estates developed before 1919) there was a surplus on dwellings of £52,390. The aggregate capital expenditure on dwellings to March 31, 1924, was £3,031,138, including £37,079 added during the year to March 31. The debt outstanding was £2,516,151. In respect of clearance schemes there was a deficiency of £46,687, mainly attributable to debt charges, which is met by a transfer from the Special County Account. The aggregate capital expenditure on clearance schemes to March 31 last was £2,734,734, and the debt outstanding at that date £916,084.

As regards assisted schemes under the Housing Act of 1919, the loss on dwellings and estates in the course of development was £408,058, compared with £402,355 in 1922–23, while the loss on clearance schemes amounted to £4,359, against £2,758. In addition, £254,546 was refunded to borough councils in respect of deficiences on their schemes. The financial result for 1923–24 was a deficiency of £701,412. The capital expenditure of the Council to March 31, 1924, amounted to £9,543,433 in respect of dwellings, and £12,464 in respect of clearance schemes, or £9,555,897 in all.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

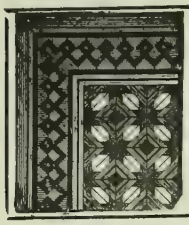
WOOLSTANWOOD.—Provision of housing accommodation on small holding, for Cheshire C.C. :—

*John Harding, Nantwich £270

Tenders.

The accepted tender (Messrs. Jones & Seward) for the foundations of the new Bournemouth pavilion, of which Messrs. Home and Knight are the architects, should have been given as £47,175 in our issue of August 15.



Messrs. The Yorkshire Hennebique Contracting Co., Ltd., inform us that the clerk to the East Riding County Council has informed them that it is their tenders for Fraisthorpe and Lissett bridges, at £1,225 and £2,879 respectively, that have been accepted, and not as given in our issue of August 8.

The Old Arch of Lincoln.

The Office of Works has decided to schedule the Roman Arch at Lincoln. The Newport Arch, as it is known in Lincoln, is a relic of the earliest period of the Roman occupation of Britain. Formed of 26 huge blocks of oolite, or granular limestone, it was the northern gate of the Roman city that was laid out on the summit of the steep hill which, centuries later, was crowned by the Cathedral. It is said to be the only Roman gate that exists, apart from the Balkerne at Colchester.

New School Buildings.

In a circular to Education Authorities the Board of Education draws attention to the fact that if progress is to be made in the supply and development of advanced instruction under the Education Act of 1921, the size of the classes in which it must be given must be limited; and in a previous circular the Board intimated that it could not accept plans of new buildings or extensions the classrooms of which are designed to accommodate more than 50 scholars. The Board now states that in future new buildings and extensions must be so designed that the classrooms shall provide 10 sq. ft. for every scholar under 11 years of age, the maximum number of scholars in a room being 50, and for scholars over 11 the space per scholar must be 12 sq. ft., and the majority of these rooms must not contain more than 40 places.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

—No. 4256. AUGUST 29, 1924.

LOST TIME

HE resumption of work by the building industry must bring to every thoughtful person some reflections upon the position of building in this country, and it should be remembered that those interested are far more numerous than the parties to the dispute. There has great tendency in recent years on the part of various o regard their internal differences as private matters disregard the interests of the public and those pro- classes who are concerned. An essential trade can, of adopt this attitude to a limited extent with impunity; erience shows that even in technical matters, in which ic might appear helpless, human ingenuity will even- nd a means of dispensing, if only in part, with any which it employs, if such machine proves to be fre- breaking down and to be demanding increasingly conditions in order to work satisfactorily. Our interests er specially those of the employers nor the operatives, he building industry as the servant of the public; e may be allowed to review this dispute from a dis- e standpoint. And it is worth reviewing, for only by nsideration of the outcome of these disputes can means ed for preventing them in the future.

Initial difficulty was the independent action of the l section of the trade in agreeing upon a wage which roportionate. At the time this was arranged, the em- ere quite within their right in making any terms they fit with operatives in the Liverpool area, which was time when the public, still in a state of what may be tificial wealth as the result of the war, were pre- have increased costs passed on. The present settle- uld at least teach us all one lesson, demonstrated ten enough in the last few years, but not yet learned, hat there is a limit dependent upon the national state beyond which the public cannot and will not shoulder costs of any commodity. The employers' federation have adopted a perfectly logical course in its attitude Liverpool, and one cannot help feeling that this area a great dis-service to the trade by not making a more attempt to settle its own differences before involving e country in this disastrous stoppage. The non- e by the operatives as to working hours as required Fraser" award is regarded as striking at the roots nourable settlements. There is only one way, short y, of composing differences, and that is by arbitration, ards are dishonoured by either side sooner or later lt will come home to the erring party. We find that outes there is a growing tendency for what we may terclaims to become more and more extravagant. waste of time and money to demand something which ly beyond reach, and we would point out to disputants ympathy of the public, which, after all, is a fair indica- e nature of the award of an independent arbitrator, nore likely to be obtained by moderation than by nce.

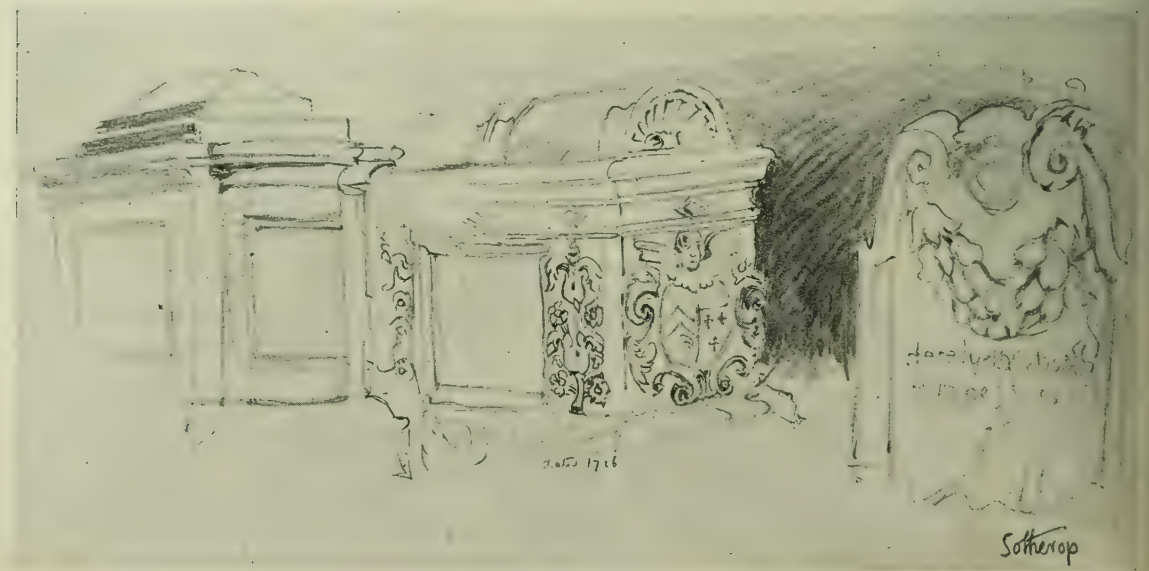
emand for increased wages we have never been able as the main factor of this dispute. Wages in the rade have for some time compared very favourably e in other industries, and the settlement reached pear to confirm our views. There is, of course, a ndency on the part of any body of persons whose re very much in demand due to great arrears of work vantage of the situation in order to exploit their own though we have always wished to see building opera- ciently paid, we would again remind them that dis- locations do not help an industry. Those of us who are old enough to remember the great masons' strike years ago will probably agree that since that strike the masons' trade has never recovered the position it previously occupied, and though at present certain house-building trades are vital, if these trades are to prove increasingly difficult we have no doubt that they will suffer in years to come by the substitution of other materials designed to dispense with their particular form of service. Speaking generally, however, we do not believe that the main body of the operatives wish to exploit the situation, but signs are not wanting that an element exists among them which by methods, the constitutional nature of which is at least debat- able, is making a business of stirring up trouble and discontent. The genuine workman is at least as shrewd as the platform orator, and it is "up to him" to see that the organisations which he has assisted in building up to safeguard his own interests remain his servants and do not become his masters. That he has already begun to wonder how far his interests are really being served seems to be proved by certain movements among the operatives, especially in the provinces, during the strike. We have nothing to say against trade unionism properly and fairly applied, but it can get on very well without Com- munism. We have passed the days of sweated labour, and trade combinations can see to it that a fair wage is obtainable by every worker, but it is not in the interest of any workman that his initiative should be destroyed or that his labour should be used to carry the dead weight of inefficiency or idleness on his trade. Moreover, no organisation on earth will ever result in maintaining a dead level of attainment. Any man worthy of the name wishes for a chance to rise to a better position, higher earnings, and more responsibility. A free education, for which labour has long clamoured, is now open along this path. Does labour intend to deny to adults what it demands for its children? Progress is based on the free scope of indi- viduality, and we imagine that even Communist leaders would hesitate to assent to a suggestion that they were only on an equality with their disciples.

But we must look farther than a mere resumption of work, and leave retrospect. The most that can be said for the loss of seven weeks at the very best period of the building season, and with an unexampled programme of building waiting execu- tion, is that in the result (the terms of settlement are given in full on p. 331) the operatives have another halfpenny and have agreed to carry out an award as to hours made some time ago. Liverpool maintains its privileged position and defers settlement for eighteen months. London has to be separately considered. Time lost through bad weather is a matter for a joint committee. Though thankful for a resumption, we cannot really congratu- late the disputants upon taking seven weeks to reach such very incomplete conclusions, nor, we think, will they feel much inclined to clamour for praise. Every disaster has its lesson, and it is to be hoped that the interval before February, 1926, may be utilised by both sides in inculcating a better spirit which will enable this essential industry to perform its duties to the community in a manner which shall assist the prosperity of the country and produce the small houses and other buildings so urgently needed. We imagine that both the employers' federa- tion and the unions have been somewhat shaken by this upheaval; certainly both have lost heavily from a financial standpoint, while architects, surveyors and others—the building owner, of course, most of all—have suffered very much through the delay and uncertainty of these past weeks. A prospect now appears of reaching a real understanding and peace; let us all try to see that it is a lasting peace and "get on with our job."

NOTES

The Building Settlement.

WRITING as a building owner, a correspondent says: "The building dispute has been settled by the employers and employed in that industry. But are there not others to whom the business of building is quite as vital, and yet who have no say in the matter? The discussions have been held behind closed doors, and an inordinate time has been taken to achieve so little. That section of the public who are engaged in building enterprises and, therefore, keep the building trade, both master and man, in employment, and who, further, are the sole arbiters of what the cost of building shall be, have no say in it at all. The architect, who knows better than anyone else how much work is being held up on account of high prices, is ignored. There are four parties to any building contract—the client, the architect, the builder and the operatives, either of whom is impotent without the others. Surely a dispute so vitally affecting all four should not be settled by two of the parties without the other two having some voice in the matter. The building owner and the architect lose money and are held up whilst the builders and operatives settle their affairs for them. Would it not be better in all ways, and likely to lead to a settlement in less than seven weeks, if such discussions were held in open court, and building owners and architects invited to assist?"



Maison Carrée, Vienne.

Manchester Art Gallery Competition.

APPARENTLY the conditions of the Manchester Art Gallery and Museum Competition are not giving complete satisfaction to all would-be competitors. A well-known architect writes: "I have obtained the conditions of the Manchester Art Gallery and Museum Competition, and doubt whether a better fate will attend this competition than the former one, for a fundamental error is being made in endeavouring to combine so essentially different requirements as an art gallery and a museum in one building. The amount of work required is colossal. If competitors are to be allowed free scope in their schemes it is doubtful whether double elephant sheets will be sufficiently large. The scale of the site plan required is to twice the scale of the Ordnance scale of 41.66 ft., otherwise to the scale of 20.83 ft. Surely this plan might have been 20 ft. to the inch, which bears some proportion to the eighth or sixteenth scale. Then, again, the plans are required to be one-sixteenth scale and the elevations one-eighth, which renders it exceedingly difficult to compare plans with elevations in composition. elevational and sectional drawings be rendered in monochrome. No beautiful drawings will result, b appears that it is wished to judg competition on the lines of the submitted by students in archite schools. Finally, the requirement such as to rule out all competitor cannot afford to run a large office for the design must be the compe own work, and the drawings prepa his office."

Londoners and Their London.

ress. Although the majority of Londoners may pay but little heed to what is going and them except it immediately them, we are fortunate in having tees and writers who take a keen in the development of the city.

A writer in an American journal says: "One of the most noticeable features in the English press during the past two years is the attitude in regard to blatant modern developments; the proposed destruction of many of Wren's London churches to make way for commercial buildings; the cheap-john-building; the electric signs; the disfigurement of the country lanes and roads following the advent of the char-a-banc; the dismemberment of beautiful estates and the building upon the ground thus obtained the smug and depressing housing developments; the high building propaganda; and the thousand and one things by which beauty is destroyed in the name of efficiency, but in reality for a pittance, and often only for a promise of profit." Apparently in what we look upon as the home of commercialism they are not too satisfied with some of the results of "blatant modern development."

The Art of the Silversmith.

How far we are from understanding the nature of art is particularly noticeable in an account which appears in a contemporary of the art of the gold and silversmith. The writer speaks of the disappearance of the art, and gives various reasons to account for it at the same time. What is so particularly noticeable in the account is the absence of any understanding of the real causes for decline. Referring to what still exists of the art, the writer tells us "much of it consisted of reproductions of pieces of plate dating from earlier periods," and elsewhere, "For instance, there is one elderly worker who has reproduced Elizabethan silverware with such artistic skill that it is quite possible in years to come his reproductions will be sought for above all others." The statement speaks for itself. There is a statement, "at the moment it is certainly the styles of the period corresponding to the reign of Queen Anne that are in the ascendant," from which we have no great difficulty in accounting for the decline of the art; for an art which is not reinforced by first-hand vision and experience is but a lifeless survival.

Reproduction and Art.

How eloquent is what we have quoted of the misdirection of our thoughts as to what is needed to recover the art of the gold and silversmith! Was the value we set on Queen Anne silver due to its lifeless imitation of an earlier period of the art, or from its power to be itself, to express what was best in the vision and craftsmanship of its own time? Only when the art of the gold and silversmith takes on this first-hand and personal character can it hold much value for us. If we are to have again a vital craftsmanship, it will be because it is free to feel and express its own vision in design and treatment.

Pont du Gard, Nîmes.
From a Sketch by Mr. F. W. Knight, A.R.I.B.A.

GENERAL NEWS

Architect's Estate.

Mr. F. H. Moore, J.P., A.R.I.B.A., of Northgate-street, Warwick (net personalty of £3,700), £6,868.

Northampton Polytechnic Institute.

The syllabus of the Northampton Polytechnic Institute, St. John-street, E.C., for the session 1924–5, has just been issued. Particulars are given of courses in civil and mechanical engineering, optics, chemistry, horology, and women's trades and domestic economy.

Obituary.

We very much regret to announce that Mr. J. A. Gotch, President of the Royal Institute of British Architects, has been bereaved by the death of his wife, who passed away at their residence at Weekley Rise, near Kettering, on August 20.

The death took place recently of Mr. W. S. Frith, a Fellow of the Royal Society of British Sculptors. Mr. Frith was possibly best known as modelling master at the City and Guilds South London Technical Art School, and among his distinguished pupils was Sir George Frampton. Mr. Frith executed a large amount of detail and ornamental work for many eminent architects.

Auctioneers' and Estate Agents' Institute.

The London Meeting of the Members of the Auctioneers' and Estate Agents' Institute of the United Kingdom will take place from September 2-6. The joint headquarters during the meeting will be the Hotel Cecil, Strand; and the Hotel Russell, Russell-square. On September 4, a paper will be read at the Kingsway Hall, at 10 a.m., by Mr. G. G. Head, on "Housing: The Common Task."

New Housing Act.

A circular to housing authorities and county councils in England and Wales was issued recently by the Ministry of Health, dealing with the Housing (Financial Provisions) Act, 1924, and explaining the general scope and objects of the Act. It can be obtained direct from H.M. Stationery Office, Imperial House, Kingsway, London, W.C.2. Price 2d. net.

Municipal Buildings, Bristol.

A new scheme has been prepared for Municipal Buildings at Bristol by Mr. C. F. W. Dening who proposes to utilise a site in Queen-square with a thoroughfare opening from Baldwin-street. The building would cover about two acres on an island site, and would house the whole of the administrative departments, besides the Lord Mayor's state apartments and the council chamber. Mr. Dening estimates the cost at about three-quarters of a million pounds, which is considerably below the estimate for the last scheme of municipal buildings in College-green.

A Thirteenth-Century Glasspainting.

With the assistance of Sir Otto Beit, K.C.M.G., and the National Art Collections Fund, the Victoria and Albert Museum has recently acquired a panel of thirteenth-century stained glass. The panel, about twenty inches square, is in good condition, very little decayed and practically free from restoration. It shows a saint disputing before an audience, and is a typical example of the style of the thirteenth century. Its place of origin is unknown, and it belongs to a period of stained glass design in which it is very difficult to make a distinction between the schools in France and in England, but the history of this particular panel makes it probable that it is English, and in any case it is an example of the art of stained glass at the height of its achievement. It is exhibited among the thirteenth-century stained glass in Room 110.

New "Underground" Stations.

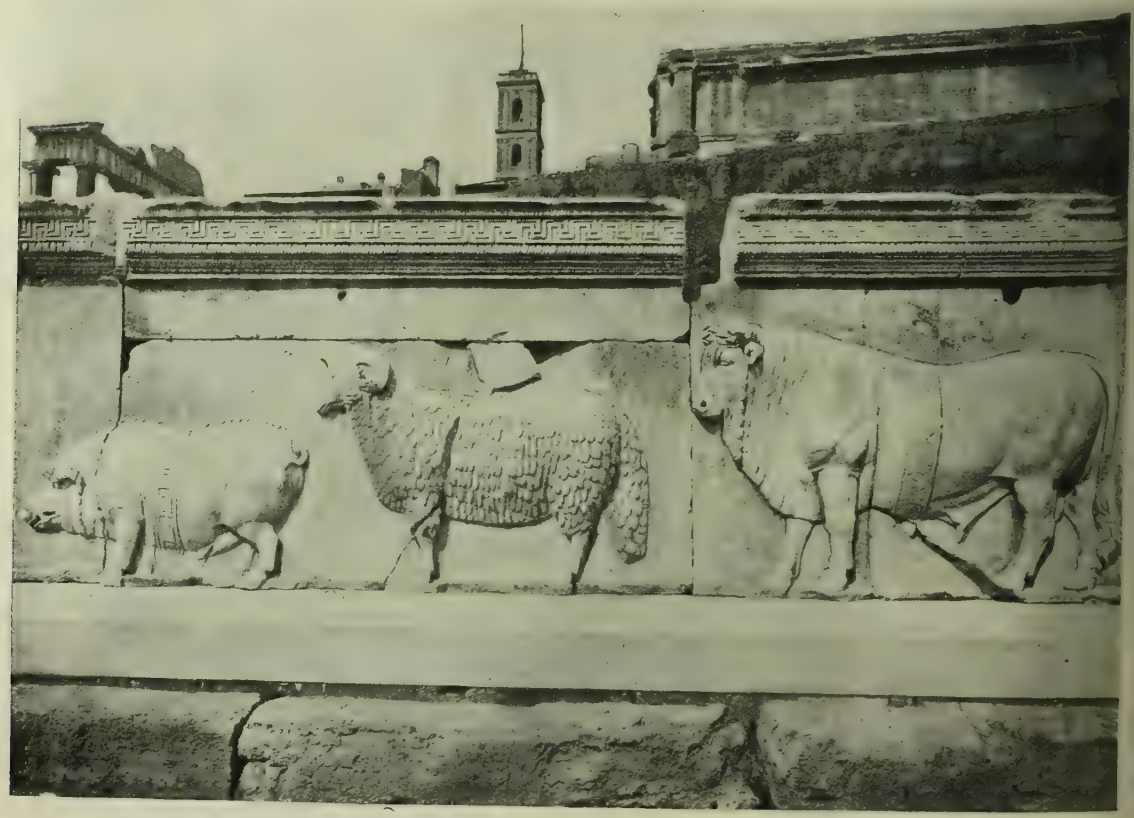
The architect to the Underground Railways Company is Mr. S. A. Heaps, and not as stated in our last issue.

COMPETITION NE

Manchester Art Gallery.

The conditions of the competition fo tectural designs for the new art gall museum of art to be built on the Pi site have now been issued by the Corp and a copy may be seen at *The* office. The building is not t more than £300,000 and is to be of P stone. It must be approached by a f steps and must include a Hall of Mer commemorate Manchester men of a and services who fell in the war. Th of assessors consists of Mr. Paul Wate Professor C. H. Reilly, of Liverpool, a P. S. Worthington, who will awar prizes, the first of £500, the second o the third of £200, and the fourth of The building is to occupy an area n ceeding 5,500 sq. yds., and the total flo required for the central sculptural 6,000 sq. ft. (See our issue for Aug. 22.

Club Premises.



The committee of the Rhyl Conservati invite schemes for adding a second story Club premises. Particulars from the Sec Market-st. Rhyl.

The Harrogate Infirmary.

The committee of Harrogate Infirmary designs for the extension of this Inf Mr. Sydney D. Kitson, F.R.I.B.A., ha appointed assessor. Premiums of 150, 10 50 guineas will be awarded respec Sending-in day September 30.

Other Competitions.

Other competitions still open includ following (the dates given are, first the a in date, and second the issue of *The Bu* which full particulars were given):—Ross Memorial (Sept. 30; Feb. 22). Hamilto Memorial (Sept. 1; May 30). Gl sgow School Memorial (Sept. 30; June 13). Baths, Newton-in-Makerfield (Sept July 11). Bexhill Hall, banned b R.I.B.A. (Sept. 1; May 30). London banned by R.I.B.A. (Sept. 24; Augu

IMAL SPIRALS FROM ASIA TO CENTRAL AMERICA AND NORTH BRITAIN*

By W. R. LETHABY.

is an interesting and attractive book World influences in ancient American ubject with which I attempted to deal inexpert way a few months since, rticle under the title, "Hellenistic Art tral America." The author of this is an expert, and although the argus made to turn on the question of Indian elephants are represented in sculptures, the wider implications are his mind. The illustrations are all ts of a bold type, several of which seem xcellent in themselves and the whole of ive a certain brightness and energy to pearance of the book which is most t. Plates 8, 11, 21, etc., engraved in *ouches* on a black ground, in a manner calls mezzotint, and others, as for ex-Plate 3, in a white *line* method, are ad-. Some are almost as rough as chil-linoleum-cuts, but even these are e rather than affected. It is delightful direct craftsmanship in book illustration ore. The author says of his main thesis, stigation convinced me that the pre-ian civilisation of America was not due to independent invention, but was l mainly by immigrants who, during t twelve centuries of the Christian era ssibly earlier, crossed the Pacific and in Honduras and elsewhere the germs World culture with traits suggestive of dia. . . But we were met by a solid of opposition. . . It seemed desirable s the discussion on one issue. . . Hence e calling attention to the fact that at in Honduras a sculptor, several cen-before Columbus, had carved an unmis-Indian elephant ridden by a turbaned ." In its wider aspect the subject involves the late Dr. Tylor's theory of ndent origins, against which there is considerable reaction—"It is the ental problem of man's inventive that has to be solved."

ately as 1920 Dr. S. G. Morley, the an authority, spoke of "the extra-y hypothesis" thus: "Any attempt seeks to establish direct cultural con-between the Maya and any Old-World tion is quite at variance with the re-f modern research. And yet the super-imilarities are such as to win for this d hypothesis new adherents." It was ese "superficial" similarities that in-ently convinced me that not only and Chinese but Hellenistic art also ced the development of ancient Ameri-lture; and I am of one mind with Pro-Elliot Smith on the question of ele-, and in regard to the relation of can pyramid structures to those of

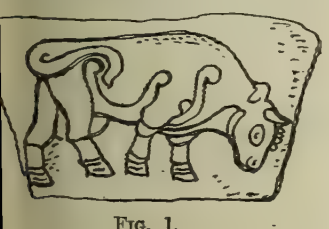

FIG. 1.

n Asia, the islands, Southern India, ssyria.

rn here to discuss two minor points specially interest me at this moment—spirals and the sea monster known in as the Makara. One of the details of ison between sculptured elephants' in India and America is a formal spiral covers their cheeks. Professor Elliot

*phants and Ethnologists." By G. Elliot Woodcuts by A. Horace Gerrard and K. emberton. (London: Kegan Paul.) Price

Smith shows that such spirals occur not only on Indian sculptures, but spirals appear on the bodies of some elephant-like creatures illustrated in Stuart's important volumes, "The Sculptured Stones of Scotland." He quotes that author as saying, "the ornamental scrolls found on the elephant were not found on any other beast," and he adds, "in my opinion these scrolls were derived from the Indian sea-elephant type of Makara. Again, in another passage he writes, "It is known that the spiral was a frequent addition to a variety of animal designs in Eastern Asia as early as the Han Dynasty in China." Is it really possible that animal spirals found from Scotland to China and then beyond the Pacific, in America, had a common origin? I think so. My special attention to these spirals was attracted some thirty years ago when drawing a remarkable incised figure of a bull on a small slab from Burghead, near Inverness, now in the British Museum (Fig. 1). This stone is one of several found on the same site, and Dr. Joseph Anderson thought that the bull might date from the seventh or eighth century and have been a local Pictish symbol. Now the creature is very remarkable as a work of British art for, notwithstanding the formal spirals of the delineation, a grazing ox has never been more clearly seen. Some deer on a grave slab

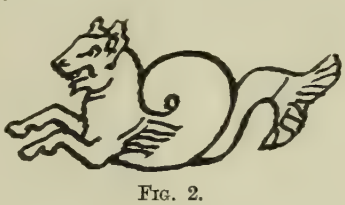

FIG. 2.

figured by Anderson have much the same character, also, I think, similar spirals. Strongly marked spirals occur on some deer which occur on the bronze mountings of a well-known early Saxon (?) bowl found, I believe, in the south of England. These animal spirals had impressed themselves on my mind, and when in turning the pages of Reinach's *Repertoire* of Reliefs I found a row of animals (on a metal plate, I believe) with similar spirals described as Scythian, it raised the question: What can have been the relation between this remote art and the bulls of Burghead? In recent years the general question has been very fully answered, although there remains some mystery about the special beauty of the bull stones. In the recently issued Guide to Anglo-Saxon Antiquities in the British Museum, 1923, is written this: "Southern Russia is now recognised as the original home of two elements in Teutonic art—the animal motive and the application of coloured stones to metal, and it is agreed that the Goths and their associates owed their efficiency in the arts to the civilisation which they found on the northern shore of the Black Sea. . . The Scythians were an Iranian people and their art was Oriental, including above all animal motives distinct from those of their Greek neighbours, but connected with Persia and Assyria. . . . Most of the elements of [old] Gothic culture had been long in existence when the Germanic horde arrived. Their part was to disseminate it in the West. . . . . Iranian influence has been detected in Chinese culture of the Han Dynasty [*cf.*, Prof. Elliot Smith above]. It was from the Scythian culture of South Russia that the Goths acquired the taste for animal ornament of which a specimen is illustrated." This illustration is of a very heraldic lion, and on the neck against the shoulder is a large strongly marked spiral. Other animal spirals also occur on some bronze brooches figured in the same guide. There is thus agreement among experts that animal spirals from Scotland to China followed one tradition. Its origin is, I think, likely to be found in the strongly marked forms of Assyrian sculptures. The Burghead bulls are more masterly and less mannered than any other British works of this class, and I wonder whether they are not evidence for some early "Gothic" expedition across the North Sea when the original

FIG. 3.

Scythian impulse was strong. There must have been some not too remote connection between them and the great art of the nearer Asia. Notice the feeling for spiral arrangement in the tail overlapping the body spiral.

Little room remains for discussing the which the dragon is the best-known variety." Makhara—"the composite wonder beast of Here again Babylonia seems to have been the prime source. "The Babylonian Capricorn was the prototype of the Indian Makara." Capricorn was made up of the forequarters of a goat with a strong fish body and tail. In the Indian form the monster has various animal heads, ox, lion, ram, elephant, and the body part is violently twisted in a spiral. Examples of the earliest forms are given in Plate 17, and one of these is copied in my Fig. 2. I give this because it is so exactly like the mythical sea monsters of Hellenistic art such as those which appear on the great pedestals of the Temple of Artemis at Ephesus, which may be dated about 350 B.C. Fig. 3 is a restoration of one of these made up from two fragments, but there were at least four, and probably all had different heads. These grotesque creatures came into Greek art from the Near East, but it may not be doubted that it was the Hellenistic form which was passed on to India. The Makara seems to have been a man-swallowing and ejecting monster, and it may be observed that in early Christian art Jonah's "whale" is represented in the form of these composite creatures. They appear also on Roman mosaic floors in Britain.

THE SEVEN AGES OF THE ARCHITECT

First: The bright cherub whom wood bricks enable
To build cathedrals on the nursery table.
Second: The school-boy sketching ingle-nooks
Upon the margins of his lesson books.
Third: See him cursing at an art school when
He meets the malice of the ruling pen.

Fourth is the full-blown student proud with
Able with any mysteries to cope; [hope,
Nothing dismays his pencil, brush or pen,
Nothing's beyond his reach, beneath his ken.
The *Fifth* age is a plunge into the dark—
Obscure employment as a junior clerk—
Followed by number *Six*, a glorious age
Of senior service at a senior's wage.
"I run the office and, of this I'm sure,
Know more about it than the governor."

Last comes the Governor himself, a man
Full versed in section, elevation, plan;
Also full versed in making himself pliant
To the eccentric wishes of his client;
Able to turn the said eccentric views
Into a building he will not refuse.

Thrice happy he who, having done his part,
And wrought these whims into a work of art,
Hears his good client say to friends select,
"Of this I was myself the architect."

PAUL WATERHOUSE.

CORRESPONDENCE

Hopes for Architecture.

SIR,—Glancing through the *Observer* this week-end there was a headline which very much attracted my attention, though I found little to interest me in the matter to which it referred. The words were: "Fears may be Liars," and the mind returned naturally to the article headed "Hopes and Fears for Architecture," which our old friend "Isis" wrote in the last issue of *The Builder*.

This article was a little confusing and upsetting, as it was no doubt intended to be, but the entire absence of "hopes" therein showed a lack of that balance which the title suggested. The headline referred to did indeed seem to suggest the answer to all that remained, but it cannot be left at that. I dare to head a reply thereto as above, in the hope that a better balance may be achieved, for surely hope must spring dominant from one justly struck, and, without hope, what have we left?

In the same number of *The Builder* there was illustrated a new "Underground" station at Colindale, which must have given a deal of pleasure to many who are interested in the times in which we live. Without appearing a work of genius, it seems a crisp, clean, and refined piece of design, full of the spirit of the twentieth century, and well worthy to stand in good company. The mind naturally reverts to the style of railway architecture with which we are most familiar, and to wonder what it is that has prompted this new spirit. One might imagine that the chief concern of a large railway company would be to attract the maximum number of passengers, and yet reason would scout the idea that a single man, woman, or child would be added to the daily toll as a result of a Doric portico. The old zig-zag edged canopies, the stop-chamfered posts, the deadly brickwork, and the gaping plate-glass sashes may have made an artist or two shudder, but the public approached them without trembling. Is it too far-fetched to claim that this is an instance where a commercial concern displays a desire to do a little more than its carriers' job? Is it a sign of a higher æsthetic sense that can breathe in the world of trade? Let us be generous and call this a gift, not only to the public, but to art.

We are spending a deal of thought upon one little wayside station, but we must remember that this is a typical instance of the enterprise of the Underground Railways, that the latter is a typical modern commercial concern, and that commerce is very typical of modern life; then this little example may, perhaps, be recognised as an architectural expression of the modern spirit, which "Isis" appears to dislike so much—both the spirit and the expression.

I am not sure what "bourgeois architecture" is, nor even what the term "bourgeois" is intended to convey to the mind. I suspect it to be used with the contempt that the haughty aristocrat and the Communist alike have expressed for the middle-class man. The contempt shall be forgotten, and as an aid to this we will rather use the term "commercial architecture" if this can be accepted as nearly implying the meaning which "Isis" has in his mind. I suppose "tradesmen's" or "merchants'" would be closer, but we will let it go at that, at the risk of correction.

The greater part of modern architectural effort might be justly termed "commercial architecture." If we admit that this is a commercial age, and that its architecture faithfully reflects it, then if we dislike it it must be the age with which we would quarrel rather than with its architecture, and this does indeed seem to be the state in which "Isis" now finds himself. If it may be said without offence, this is a very unhealthy state to be in, and the danger in this particular form of unhealthiness is that it is infectious and must be met with an antidote.

What does commerce really mean? Is it something essentially degrading and sordid? I think such a view would be the essence of snobbery. If we were to say that the main purpose of commerce was to feed us it would perhaps sound a little brutal and worldly, and yet one must live to be happy and free, and one must be fed and clothed to live, and the millions that now live on the land that once supported its thousands only, must be organised before they can be fed. Surely this organisation is the wonder of the age, and a wonder worthy of architectural expression? It is true that other systems have been tried to supplant that existing. Russia has tried one, Italy dabbled in one or two, and the German system was not ours; but I think the majority of Englishmen are thankful for the world as they find it at home.

Is it not gross ingratitude to sneer, with the second-hand label of "salesman's architecture," at the honest efforts of men to express in building the true spirit of a wonderful age? "The spirit of the times," says "Isis," "is only the shadow of ourselves." Only the shadow! Why, is not the shadow the proof positive of the substance of our very existence, or are we to play antics to distort its honest shape?

Now, let it be urged that we accept one or two realities (though it may be difficult to maintain them to one who has no compunction about doubting the reality of realities):—

(1) Modern life is indeed complexity itself.

(2) The only way to unravel the complexity is by organised effort.

(3) This organised effort implies individual control (the poverty of the single mind, if one likes the sound of it).

(4) That the architect stands for this individual control in the production of buildings.

(5) That this function of the architect cannot fail to produce an entirely different spirit in architectural expression from that that existed in simpler times.

(6) That this new spirit in the building art can be just as pure and vital as the old because the purity and vitality of both is only measurable by the faithfulness it shows towards the age in which it lives.

Let us recognise the signs of the higher vision of commerce and rid ourselves of the delusion that trade is all a scramble for money. The facts are all there for us to see, and we have only to remove the bandage from our eyes to gain heart to build.

Finally, may I ask "Isis" his own question: "What is the use of stating things for which we have no solution to offer?"

G. MAXWELL AYLWIN.

"London on the Thames."

SIR,—In the review of my book, "London on the Thames," which you did me the honour to publish in *The Builder* for June 27, your reviewer states that he fails to understand my statement that the streams of London influenced the line of the Wall. It is true that the main stream of the Walbrook flowed through the City in Roman times and did not form a boundary to it (though it seems not impossible that it did form a boundary to the original oppidum). The contours of the City indicate, however, that *tributaries* of the Walbrook, flowing from east and west, gave the line of the northern and north-eastern sections of the wall (see maps, pp. 42, 60, and 65).

With regard to the problem: What caused the rectangular bend in the Wall at Aldersgate? I have suggested a solution in my maps, although it is true I have not discussed the matter in detail.

The contoured map shows a depression in the angle of the Wall west of Aldersgate. There is evidence that the ground in this was swampy before the construction o Roman wall. Richard Kelsey, in his veyor's Report as to the Main Lin Sewer within the City of London, 1842," "From Aldersgate, it (the land) rose to and beyond Aldersgate Bars to Old-stre thereabout, and thence fell northward; y lateral watershed of the land lay thence, ward, into the hollow occupied by the Sh alley sewer on the edge of Smithfield." hollow was probably drained more or le a stream (? the Faggeswell Brook "London on the Thames," p. 51) whic ceived a tributary from the south-east, from the angle of the Wall in question. dence of the marshy nature of the ground may be gathered from the fact that ther no records of Roman dwellings north of gate-street except for a pavement on th of Christ's Hospital (vide *Archæo* Vol. LXIII, p. 297). A trial boring 84 ft. east of Giltspur-street and 66 ft. of the backs of the buildings in New street showed that the angle bastion at gate rested at 12 ft. on a substructure was not laid on the original surface, as i case of all other parts of the Wall exam but on an accumulation of made earth uneven, hollow spot, very wet. The R Gate at Newgate was constructed conside later than the wall; there was no poi providing an outlet from the City in direction until the level of the district been raised by accumulations and the g to some extent drained. At a later dat site was used as a burying-ground for v of the plague, 1349, because the City ch yards could not hold the dead. Part of it built upon by the monks of the Charterh who no doubt helped to drain the land, became a playing-ground of the citizens. revelries and jousts were held, and finally turned into Smithfield Market. This I dealt with in my book on page 136.

Of course, at any time during excava discoveries may be made which upset theories. Nevertheless, the evidence swamp in the neighbourhood of Smithfiel the Charterhouse, draining to the Holbo fairly strong and appears to me to give a factory explanation of the bend in the W the City which has puzzled your reviewe many others.

I shall be glad if you can find space fo letter in spite of its inordinate length. a subject appears to be one of general int I personally should be glad to learn o other theories regarding this problem.

HILDA ORMS

Our reviewer replies as follows:—"I been suggested that the existence of a st at the north-west of the town caused the angular bend, but the evidence for this—fact, for any theory—is, we believe slight. The fact that the bastions, t probably built at a later date, were as n ous on the north-west as on the east, while there were very few or north, suggests that the marshy c ter of the ground, being a n defence, was confined to the north, as the Romans were able to build a there, it may be assumed that they could completed the semi-circle had they wish do so, in spite of marshes. However, probability it was simply the hap growth of the town in this direction tha tated the outline of the wall."

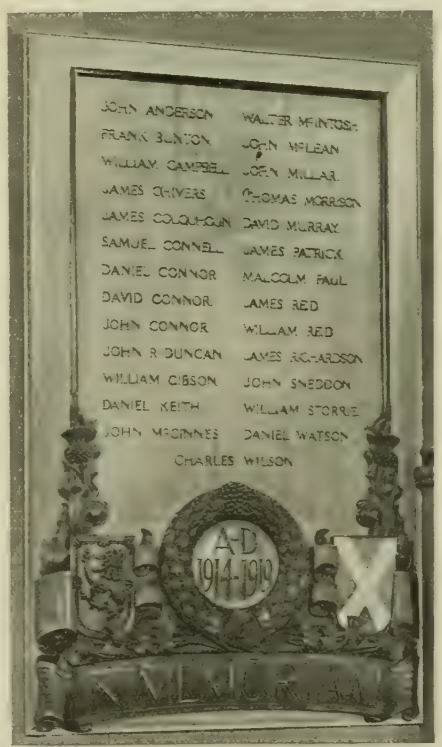
Building Wages.

SIR,—It would be nice of the buildin ployers, now that the men have return business on the agreed terms, were voluntarily to give an additional halfpen hour. Such an act would go far in pro the much-desired good relationship, and the nature of an investment yielding its r that is, if my conception of human nat not hopelessly wrong, and I do not think

STREET ARCHITECTURE—VIII.

By V. M. CHRISTY

BAKER-STREET.



STREET is a thoroughfare which pos- strongly marked a character in its ays that it maintains its individuality w, through all the vicissitudes of noving times. In 1741 open fields to Portman Square, southwards " New Road from Paddington," occasions these fields must have short cut for pedestrians from the of Hampstead and Highgate into Until about ten years ago there house in Orchard-street which was block in the days of Tyburn execu- his house had a specially strong iron- oor, made to withstand the crush o ing mobs swarming in from the to witness the hangings. In 1784 utions at Tyburn, with all their ageantry, came to an end, and by soon after then, Baker-street was in Many of the streets and squares here- ok their names from titles or country s of the ground landlords. Thus square and Orchard-Street are named rchard Portman, Lord Portman's shire seat; and Baker-street was so m Sir Edward Baker, a Dorsetshire of the Portmans, who helped to heir London estate.

tury ago Baker-street was mainly l; now it is almost entirely given business. A board announcing o be erected on this valuable building ts the position tersely and unmis- But the transition has, up till now, gentle and mannerly that there is ething unique in the status of this There is a remarkable dignity and iteur about it. To a large extent s remain as of old, with their brick- lconies, steps and broad doorways, in line, tidily, rather sternly. There in impersonal independent air about They lack any obtrusive interest in ghbours, but at the same time they idably linked with them in the com- se of presenting an harmonious and face to other sections of society. ines of similar houses elsewhere, of e date, suggest a degree of infor- n almost merry air of taking an in- terest in each other's business. But the verge of Portman-square, have air. They would never nod good to each other as Kensington houses In places some of the heavy studded ain, but beside them there are now five bell-pushes, betokening the n the type of occupants. But even shops and offices have taken pos- f the former dwelling-houses that rmality remains. Perhaps it is be- shops and even the offices are con- ith commodities and services of a kind: hairdressing, photographic por- catering, the selling of flowers, bric- d antiques, and the carrying on of fessions as Court dressmaker and ent. Baker-street, no longer residen- ame the perfectly trained " Butler uares," as a lady who knew it well cribed it. The " butler " is losing y not a little now that larger plate- p fronts are succeeding the more lisplays, and a sprinkling of small ts and teashops has appeared. Of eet in the later half of the nineteenth former Orchard-street resident re- The cattle show used to be held at Baker-street Bazaar, under Mme. . and of course the waxworks were years. These facts, and being the ing route to Lord's for the great made it a very gay thoroughfare at mes. At others it was quiet, with two old 'buses, ' Atlas ' and ' City Atlas ' at intervals, and the stately carriages with smart horses and servants from the Portman-square houses, with the different coloured liveries and hammer-cloths over the coachman's seat." It is also significant that it was essentially a " hansom," not a " four-wheeler " street. The Baker-street Bazaar, referred to, was first opened for the sale of horses; later it was only for " carriages, harness, furniture and other household goods." The motor carriage showrooms have now installed themselves in one or two positions, but in the quiet decorous manner which the street demands.

Among the few new buildings in Baker-street, one or two are a trifle too gaunt and soulless for the street. They are not actively objectionable, but they seem out of place. Some others have absorbed the atmosphere of the street so well that although quite different in character from the original buildings they harmonise perfectly; they move in the same social circle, and that is a great point if Baker-street is to remain harmonious. The prevailing material in the older buildings is brick; subsidiary to this are stone or stucco, and ironwork, which each contribute their due quota to the dignified and simple whole. Some of the newer buildings fail to respond to the demands of the street because they contravene the canons governing the satisfactory mingling of these elements. Where the older brick fronts form unbroken lines for some distance their continuity is emphasised by a thin line of stucco decoration, and the individuality of each unit is marked by the varied designs of the ironwork on balcony or railing. More recent imitations of this type are unsatisfying because smooth continuity is lost beneath fussiness of detail, and the individual ironwork is poorly impersonated by paltry and purposeless little borders to window sills, almost all of one stamp. In some cases modern red brick and stone dressings are happily combined; in others the essential brick character is obliterated by an excessive application of the stone element, leaving a restless and uncertain impression. Such an impression is avoided where the building is stone-faced entirely, or where the brick is made clearly to predominate. No attempt is made in these cases to introduce the third element, decorative ironwork, at all. In the most modern type, however, the idea of iron for decorative purposes is entirely superseded by its constructional use in the form of girders and stanchions. So much is this so, that in certain cases the other materials employed with it seem to have assumed a curiously cold and metallic nature. This effect leaves one doubting whether " truthfulness " of structure is really a point on the highway to architectural beauty or not. After all, it must be admitted that the human skeleton is clothed with flesh in a manner which does not follow out to its logical conclusion the theory of structural truthfulness. Why, therefore, should not the gaunt skeleton of structural steelwork be clothed externally with as vivid contours as the human frame, provided that, as in the body, the articulation and function of the bones is unimpeded?

Victorian London of this neighbourhood expected to find in Baker-street the means to live beautifully according to its station; to have its hair dressed well and suitably; to purchase beautiful and antique objects to adorn its drawing-rooms; to have suitable catering for its balls, its parties, and its wedding-breakfasts; to be photographed appropriately on special occasions in life; and finally to be buried with appropriate but unostentatious ceremony, with a suitable supply of black silk and black gloves. The survival of the name Portman Rooms seems still to suggest the scene of gay but appropriately dignified " assemblies "; it almost takes us back to the days when Mr. Pitt resided in Baker-street.

There is still a certain *caché* about the street, which is not yet obliterated by the motor omnibuses which thunder by, no longer " at intervals," like the old " Atlas," nor by the shrill ghostly wail of the underground trains. The arrangement of the " circus " at the crossing of Marylebone-road some few years ago still maintained the old dignity. The prelude notes of the new red-brick overture, though strangely unlike the old harmonies, have no unforgivable discords. But it might well prove the beginning of the end of the real Baker-street when " the largest cinema in England " rears its head upon that yawning site near the station. And yet it need not be so. Baker-street has long been the route to popular shows: Tyburn, Mme. Tussaud's waxworks, the Cattle Show, Lord's, why not therefore a cinema? But for the sake of our self-respect let us hope it will be able to justify its existence by nobler means than by catering merely for the instincts that urged the mob to seek their entertainment at Tyburn in days gone by.

Memorial in Wallneuk Church, Paisley.
MESSRS. ABERCROMBIE & MAITLAND, Architects.

Memorial in Wallneuk Church, Paisley.

This memorial consists of a tablet of walnut on which the names of the fallen are recorded in letters of solid bronze. The tablet is edged with a fimbriation of ebony and surrounded by a frame of bleached oak; supporting it is a device in carved and stained oak emblematic of the Scottish race—a broad riband with the words " In Memoriam " stretching across the bottom of the memorial and intertwining with a thistle ornament and enfolding on each side a shield emblazoned in their proper heraldic colours and metals, the one on the dexter side representing the Lion Rampant, and the one on the sinister side the St. Andrew's Cross. In the centre between the shields is a carved wreath of laurel encircling the dates 1914–1919. The memorial was designed by Messrs. Abercrombie & Maitland, architects, of Paisley, and the work was executed by Messrs. Guthrie & Wells, Glasgow.

PAINTED WINDOWS AT BARNARD'S INN

By F. SYDNEY EDEN.

THE origins and early history of the Inns of Court and Chancery in their relation to legal education and organisation are obscure.

When they are first met with in history they were all, with one exception, totally unconnected with law or lawyers. The Temple was a Commandery of the Knights Templars, and Lincoln's Inn and Gray's Inn were town houses of the Earl of Lincoln and Lord Grey of Wilton respectively. As to the Inns of Chancery, to mention a few only as typical of the rest: Staple Inn was the warehouse where the Wool Staplers' stock of wool was housed; Barnard's Inn, under its earlier name of Mackworth's Inn, was the town house of John Mackworth, Dean of Lincoln; Clifford's Inn belonged to the Lords Clifford and Furnival's Inn to the Furnivals, Barons of Sheffield.

One of the Inns of Chancery—Lyons' Inn, in Newcastle-street, Strand—had a different, and later, origin, certain lawyers having bought the Lyon Hostelry and converted it into an Inn of Chancery in the time of Henry VIII.

It was not until the fifteenth century that most of these Inns became connected with lawyers. In several instances they were leased to various small bodies of lawyers, each independent of the others. The leases were usually renewable from time to time on payment of a fine. Gradually the Inns of Court and Chancery grew into strictly organised and administered Colleges of Law, the arrangements and discipline being along much the same lines as at Colleges in Universities.

The main distinction, originally, according to some writers, between the Inns of Court and Chancery was that the former were resorted to principally by students of noble birth, while the students in the Inns of Chancery were for the most part sons of the lesser gentry and traders. Others say that the Inns of Chancery were from the beginning places for preliminary studies by law students prior to their into the Inns of Court.

After a time the Inns of Chancery b subordinate to the Inn of Court which ha to be in their neighbourhood, and each Court appointed in every term one of i members as a reader to give lectures, or, hold moots in the halls of the Inns of Ch attached to it, for the benefit of the student

The loose connection between the Inns until the end of the last century, al readers to the Inns of Chancery ceased appointed in the seventeenth century no moots or other legal exercises were h them later than about the middle of the eenth century, if we except the meetings Law Students' Debating Society, which to be held, in the 'eighties of the last ce in Clement's Inn Hall.

The end came to all the Inns of Ch before the close of the nineteenth century Inns and the other property of the Societi sold and the proceeds of sale were d between the governing bodies and the me of the Inn. The very situation of some o are forgotten and the sites of all—except Inn in Holborn and Clifford's Inn in street—have been cleared of their a houses and modern buildings run up in place. As to the exceptions, all know abodes of ancient peace, Staple Inn and Cli Inn, but Staple Inn's smaller neighbour nard's Inn, is not so well known, the perhaps, because the Mercers' Company, school the old Inn has become, has d its ancient title and called it Mercers' Sch

Barnard's Inn is on the south side of Ho a little to the east of Staple Inn, and is re by a narrow court which opens out into a courtyard shut in by blocks of modern bu forming Mercers' School, which have tak place of the old brick houses divided int of chambers which we see in old prints Inn. On the north side is the ancien only 36 ft. long, with a louvre on its roof c

In common with all similar societies, the custom at Barnard's Inn for the a the principal, for the time being, to be in the hall windows in painted glass. too, as in the halls of the Inns of Court, of arms of the reigning sovereign and of men—judges and statesmen—of the day be placed in the windows. At Barnard the arms of several long-dead princip shown; there is no royal or noble h except a roundel with a fleur-de-lis, a badge, and shields of Nevill and De Ve

The shields of principals, counting fr east on the south side of the hall, consis of a series of small ovals within plain-c borders bearing shields surrounded by of leafage and berries, and with inscript foot with the name of the principal com ated and his year of office. Some are in enamel colours, the enamel being perished; others are made of pot-met alone and yet others are a mixture of and pot-metal work.

This series begins with the arms— three saddles sable—of William Harvy, palis hujus hospitij Anno Dmi 1545 commemorating four principals in the i ends with the arms—argent on a bend between three choughs sable, as many ga of John Wicksted, principal in 1621. ovals were painted early in the seve century, and it is probable that, bein one style, the earlier of them were pai correspond with the later—nunc pro as lawyers put it.

In the second light of the second bay hall is a full achievement—a fine piece —of the arms of George Dodson, Assize of the Midland Circuit and I of the Inn in 1683. The arms are a fesse nebulee gules between six fleu sable, and the crest is two lion's legs e saltire or, armed gules.

A large composition, containing the Sir John Holt, Chief Justice of the Bench in the reigns of William and M Anne, occupies the third light of the sa

ms are argent on a bend engrailed sable, leurs-de-lis silver and the crest is a cubit ect, vested per pale argent and sable, nd grasping a pheon sable. According Latin inscription below the shield this vas given in 1705 by Silvester Petyt, an t and former Principal of the Inn and f the Writs of Error. This panel occupies ce of honour in the hall, and, no doubt, s to the high esteem in which the members nard's Inn held Sir John Holt, who has been looked upon as a model of all judge should be, both for character and g in the laws.

arms of principals are continued in the ght of the second bay and through the rs on the south side of the hall by a second series of ovals with scroll-bordered shields set within chaplets or white and yellow scroll-work. Those commemorated are Robert Clarke (1698), Edward Story (1670), Silvester Petyt (1701), the donor of Sir John Holt's arms, William Betts (1704), William Manlove (1710), and Matthew Lancaster (1716).

On the north side of the hall, in the first light of the second bay from the west, is a small Tudor-shaped shield, shorn of its accessories, bearing the arms of Nevill, argent, a saltire gules; in the second light is an oval with the arms of Dingley Askham, principal in 1722; in the third light is the royal badge already mentioned, a fleur-de-lis set in ruby (sixteenth century); in the fourth light is an oval with the arms of Wiseman Claget, principal in 1728; and in the fifth light is a sixteenth-century shield without accessories of the arms of De Vere, quarterly gules and or, a mullet silver in the first quarter.

The old glass in Barnard's Inn is completed by a beautiful little oval panel, painted in enamel colours, with the arms of a seventeenth-century Dutch merchant, probably resident in London, one Pieter Van de Putte. The arms are or on a chevron, gules between three cocks sable, three trefoils slipped or and a pair of human legs proper in sinister base. The crest is a gold trefoil slipped. Unfortunately, the sinister side of the oval is missing and a piece of white and yellow scroll-work of a similar character from a lost panel substituted for it.

Royal Naval Barracks Church, Southsea.

There are seats for 1,000 in this church, and advantage was taken of the fall of the ground to arrange a church-room under the chancel. The exterior is of stone, and the estimate was £13,350. The actual cost was £12,700.

The foundations were put in by departmental labour, and the contractors for the superstructure were Messrs. Carkeek & Sons, of Redruth; electric lighting, Messrs. Carse & Co.; heating, Messrs. Wood & Co.; wood-block flooring, Messrs. Geary Walker & Co.; tiles and mosaic, Messrs. Craven, Dunhill & Co. Mr. P. J. Marvin is the architect.

Design for a House and Grounds.

This scheme was sketched out during a summer holiday in 1919. It is an adaptation of the Sala of Italy, for the united use of one or more branches of a family. It will be seen that the distribution of the first floor in four suites carries out the same idea. The central area is adequate for dancing, &c., the floor shown being parquet. The English standard of height of rooms is followed. The inevitable motor is provided for, and the offices are cut down to the one or no servant standard of the day. Two floors only are adopted for the same reason. The idea that concrete or light steel stanchions and framework would be economically necessary has been kept in view, both in design and construction. The eight columns of the interior form the main skeleton. It was also thought possible that asbestos sheeting would form the roofing, or, alternatively, tiles of the type that can be used with a pitch of 30 degs. It was assumed that the site would be not far from the sea, but in any case sufficiently rural to make three acres obtainable. The subject has been entirely worked out and drawn by Mr. J. H. Bolton out of school hours, and the method of representation is an application of the instruction received in the first year's course of the A.A. School.

New Colliery Offices, Thorncliffe, Sheffield.

This block of administrative offices is being built on rising ground, overlooking the works, which occupy the whole of the valley, provision being made at each end for future extensions. The board room and headquarters' offices are located on the first floor, opposite the main staircase, opening off a tall architectural hall, lit by a continuous lantern.

The external dressing will be of Portland stone, the main wall surfaces being rendered in white cement, so that these may be cleaned down periodically. Owing to the situation, all building materials in the neighbourhood tend to turn black in a very short time, and it is desired to keep this office block standing out from its surroundings as much as possible, so as to be the obvious focal point to anyone entering the works. The roof will be covered in special Italian tiles, and steel windows (but to a different design than shown in the perspective) are being used throughout. The construction throughout is in reinforced concrete, with brick panel filling between the external stanchions. Ventilation ducts in reinforced concrete are provided to all the corridors and around the staircase halls, leading by vertical ducts to fan-chambers in the roof.

The heating is by low-pressure hot-water radiators, all pipes being concealed but accessible throughout; exhaust steam is brought from the works to calorifiers in the basement, so that nuisance of fuel delivery and ashes disposal is eliminated. A complete system of vacuum cleaning is also being installed.

The Trussed Concrete Steel Co., Ltd., are responsible for the reinforced concrete scheme throughout. Messrs. James Gibbons, Ltd., will supply the steel windows. Messrs. John Tann, Ltd., are supplying the strong-room doors. The Bath & Portland Stone Firms, Ltd., will provide the Portland stone.

Mr. Adrian Gilbert Scott, of 7, Gray's Inn-square, W.C.1, is the architect.

"The Times" Pavilion.

This illustration is of the pavilion built for the *Times* at the British Empire Exhibition at Wembley. It stands on the axis from the main entrance to the Stadium between the Australian and Canadian buildings.

The building, standing as it does in a central position in the Exhibition, forms a suitable rendezvous; thus it was arranged with open porticoes and a terraced garden which would make a pleasant place for waiting and resting. One of the earliest types of printing press used for printing the *Times* is placed in one wing of the building, and the other forms a library.

The pavilion is of a temporary nature, being constructed of timber and fibrous plaster. The general contractors were Messrs. Gaze & Son, Ltd. The fibrous plaster work was carried out by Messrs. G. Jackson & Sons. Messrs. Oswald P. Milne and Paul Phipps, FF.R.I.B.A., 64, Wigmore-street, London, were the architects, and the garden work was carried out under their direction.

Doctor's House at Swanage.

This house is in the main street and faces south while the back looks over the bay, the upper windows having a view over the coal sheds on the sea front. "The View Balcony," which opens off the staircase, has been provided to make the most of this aspect. The house is finished with red hand-made sand-faced facings and purple quoins of a similar texture from the north of the county. The roof is done with Fontley tiles. The arrangement of the plan provides separate entrances for patients and private visitors. The settled price, including all fittings, was £2,841. Mr. Wilfrid Travers, F.R.I.B.A., is the architect.

Shivalayah Temple.

This temple is situated on the banks of Vishwamitri River at Baroda, a native state in India. It is a square in plan, having steps to the front leading to the shrine, and is dedicated to the god Shiva, one of the chief gods in Hindu religion. It stands on a platform with an opening at the front, and leaves a margin all round the temple for pradakshina. Walls are b slabs. Columns are beautifully carved. windows have been provided in side wa light, and through ventilation. The arch Hindu symbolism of Indian temples. Th rests on an octagon which is a special fea character of Indian domes. The structur is in marble and expresses the material Mouldings and carvings demonstrate th and workmanship of Indian art and cra

L. M. Chit

Lord Kitchener Memorial Homes, Chath

This memorial (illustrated on p. 329) c of a block of four cottages for disabled and soldiers, erected on land at Fort Pit Chatham. The site is pleasantly situated, the Victoria-gardens and overlooking the with an extensive view of Fort Pitt Fi the rear, and has a frontage of 120 ft. depth of 150 ft.

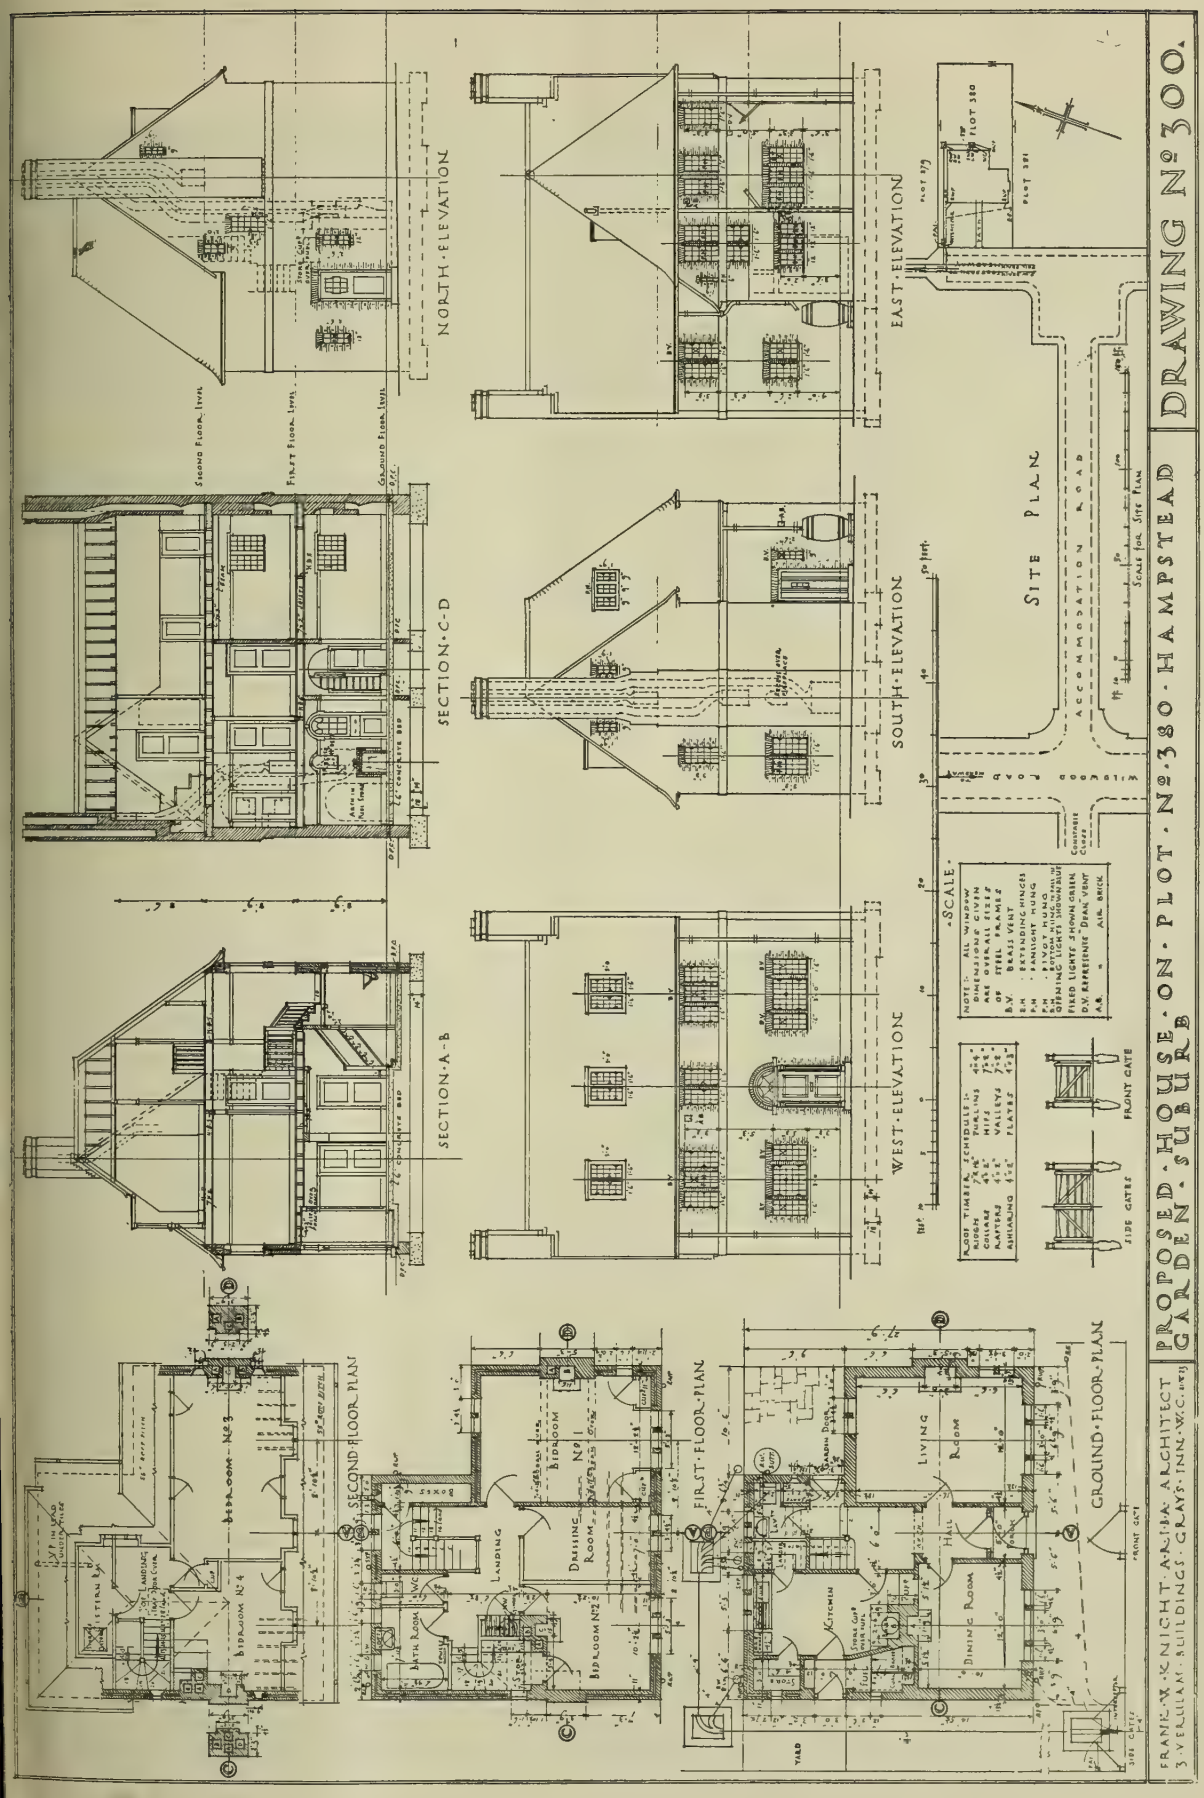
The cottages are faced with old l antique red bricks up to the first-floor lev upper portion of the walls is hung with a red tiles in alternate plain and orna courses, and the roofs are covered wi English sand-face tiles.

The two centre cottages are set para the frontage, whilst the end houses make angles forming wings to the block; th position of the buildings permits a simp out of the grounds and gardens.

The elevation to the street front is com with a fence designed in keeping with the style, consisting of a series of ramped l wood fencing on a dwarf wall of red similar to those on the buildings.

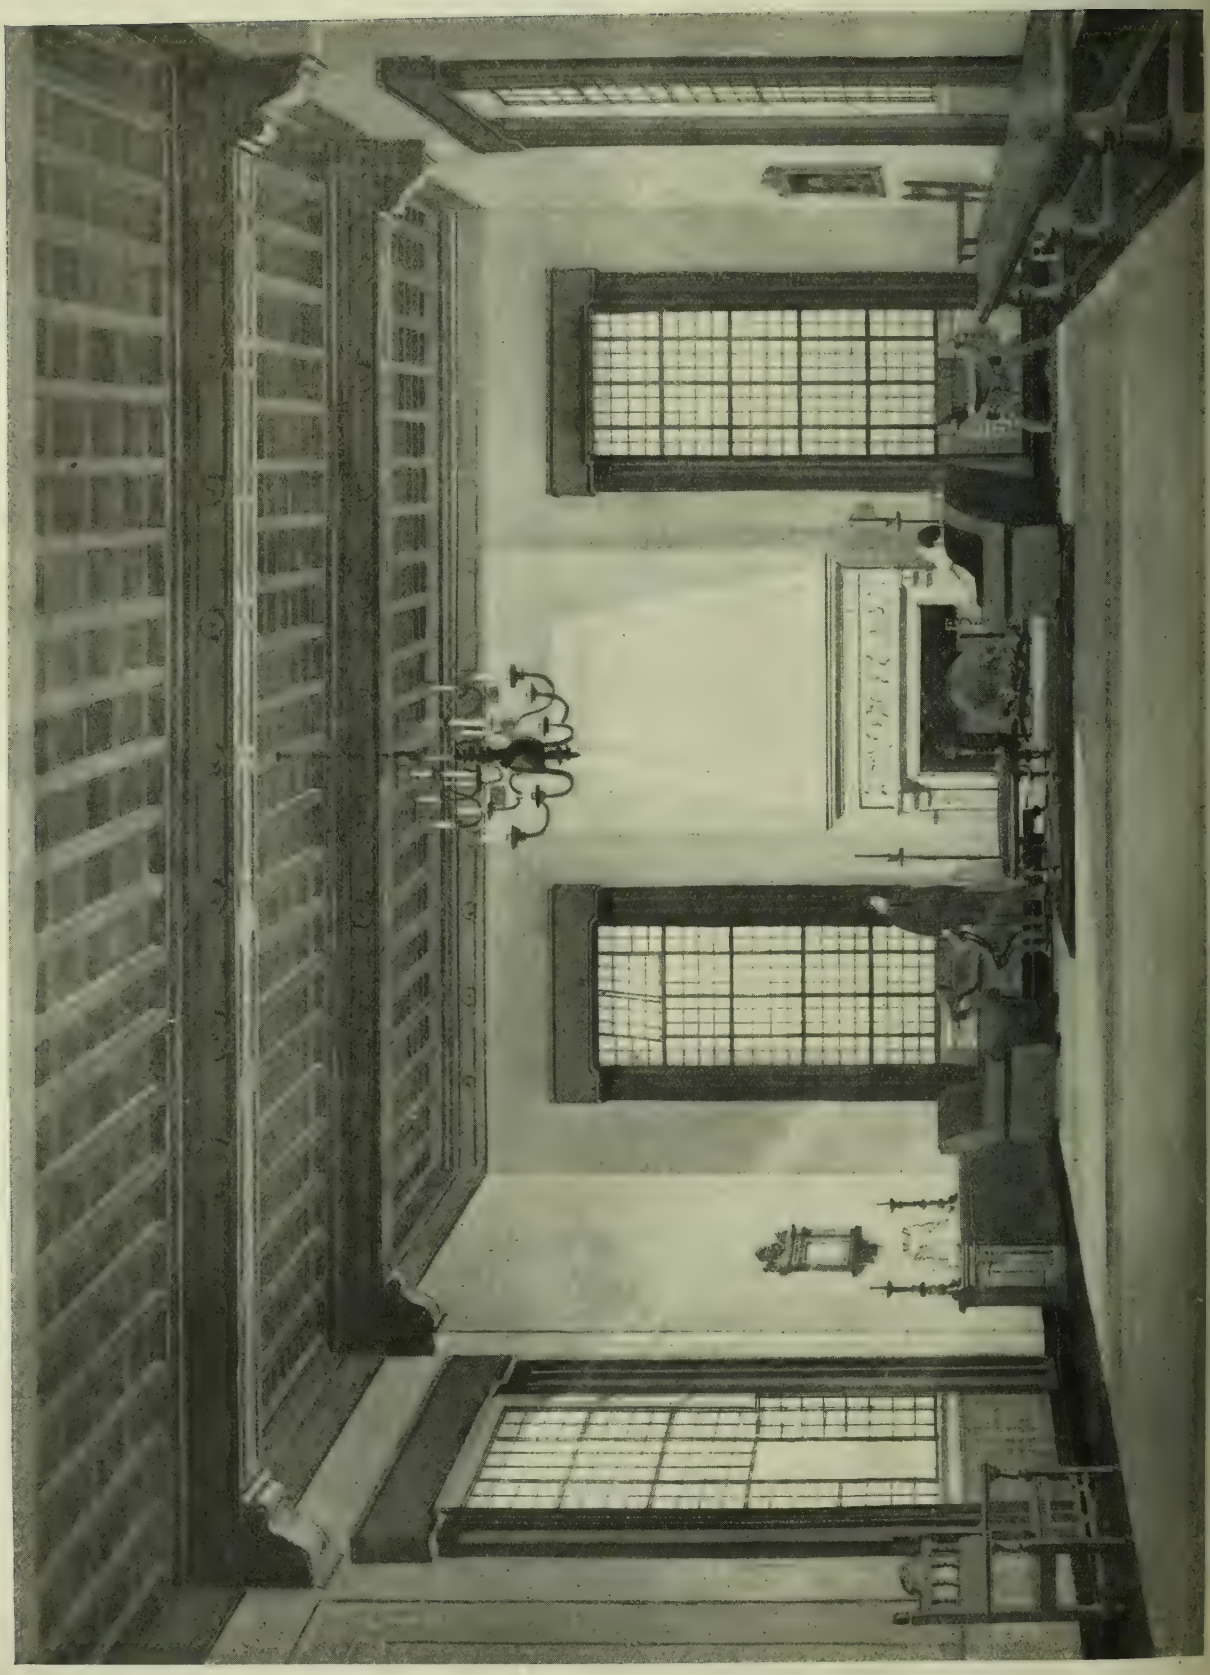
The accommodation in each cottage i entrance hall, living room (16 ft. by combined kitchen and scullery (12 ft. 9 10 ft.), bedroom (16 ft. by 10 ft. 3 in smaller bedrooms, larder, and the usual The interior decoration includes tiled fl hall and kitchen and distempered walls. cupboard room is provided.

The buildings have been designed by M Honey, F.S.I., M.S.A., Borough Engin Surveyor, who is acting as Honorary A to the Trustees. The contractor was Mr Leech, of Rochester.



EXHIBITION NOTE

POCHADES.



We should say the definition exhibition now open at the little gallery of the Beaux Art in place is rather a misnomer. It i Pochades, but if that name signifies vivid impression of a subject by the can hardly include many of the exhibi that head. The graphic sketches by W. are true to the name and we readily sh the artist his pleasure in the summarise tion of his subjects; but careful, sou painting and well-studied tone values ar composition rule out other good subj the generic title.

ETCHINGS.

We may find in the fine collection o by Brangwyn at the Fine Art Society show of this artist's wonderful power a activities. Some of them, like the seem to afford the utmost of fine po but for our own part we find the fervour of the artist less to our liking fine, peaceful breadth of the Toled The dramatic etching of the Monun our Admirable Crichton seriously at rendering the proportion and decorati of this splended example of Wren's ge know and love the Monument too well such a version as adequate representa

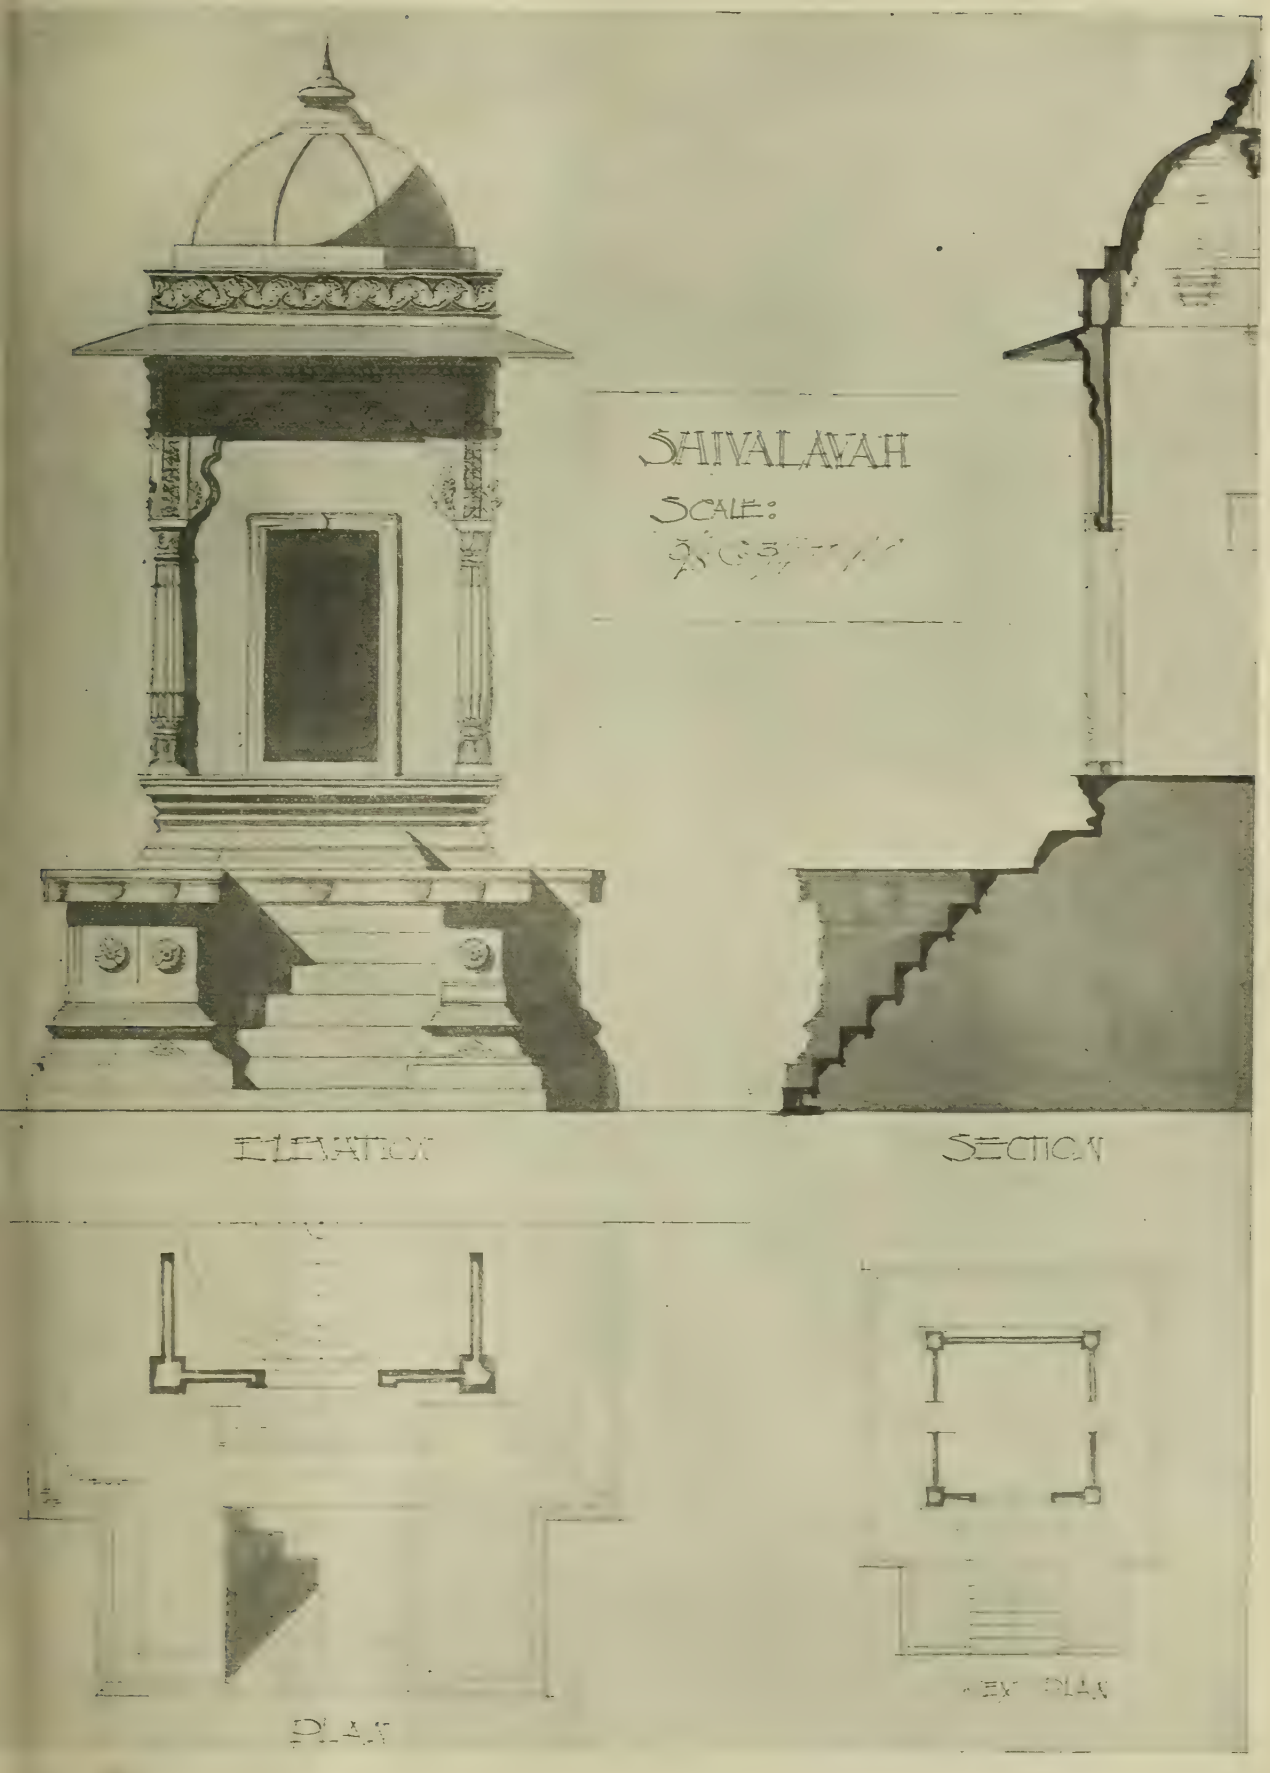
Competition Design for Offices at Liverpool for Messrs. Alfred Holt & Co.: Elevation to Water Street.

By Mr. Curtis Green, A.R.A.



MR. GERALD WARREN, F.S.Arc., Architect.

[The site of this house dictated that advantage should be taken of the southern aspect, which faces the garden, and with this object in view the plan is so arranged that a minimum number of windows, all of an unimportant character, face north, which is to the road. Externally, the house is faced with selected grey stocks with white joints, and the roof covered with hand-made sand-faced tiles. Internally, the treatment is of a very simple nature, the main effect being obtained by built-up brick fireplaces and beamed ceilings with all internal walls finished white.

As will be seen by the elevation, the addition of a garage and bedroom ove been made to the original plan. Mr. G Warren, F.S.Arc., of 12, Norfolk-street, St W.C., is the architect. Messrs. W. G. Ta Ltd., of Byfleet, were the contractors, were also responsible for the lay-out o grounds.]

THE NAVE OF HEXHAM PRIORY

BY E. BENSON, B.A.

[IN the following article the author maintains that the nave of Wilfrid's Church was not as large as some authorities claim; that there is no adequate reason to believe that the Saxon church at Hexham was of such startling proportions as have been attributed to it.]

In 670 Ecgfrith succeeded to the kingship of Northumbria, of which York was the civil and ecclesiastical capital. Wilfrid was then Bishop of York. At the time of his marriage King Ecgfrith had given to his queen, Etheldreda, Hexhamshire, a piece of land about 12 miles by six miles, with Hexham near its northern limit. The queen, who is best known as the first Abbess of Ely, was very religious, and in 673, on Bishop Wilfrid's persuasion, she became a nun. It was about this time that she presented Hexhamshire to Wilfrid. He chose Hexham as the site of the monastery he was to build there, the founding of which may have been prompted by the victory of Heavenfield (about 40 years earlier) for that victory had ensured the success in Northumbria of Christianity over paganism. Bede, in his "Ecclesiastical History of England" (*c.* 731), says that "the brothers of the church of Hagulstad (Hexham), which is not far thence, repair yearly on the day before that on which King Oswald was afterwards slain, to watch there for the health of his soul, and having sung many psalms, to offer for him in the morning the sacrifice of the holy oblation."

Wilfrid, who was a Northumbrian and a very active churchman, had already built a church at Ripon. At Hexham he set out to build a monastery which was also to contain the seat of a bishop. In 678, Hexham became the head of the new province of Bernicia, and the Bishop of Hexham was consequently the spiritual ruler of this part of the country.

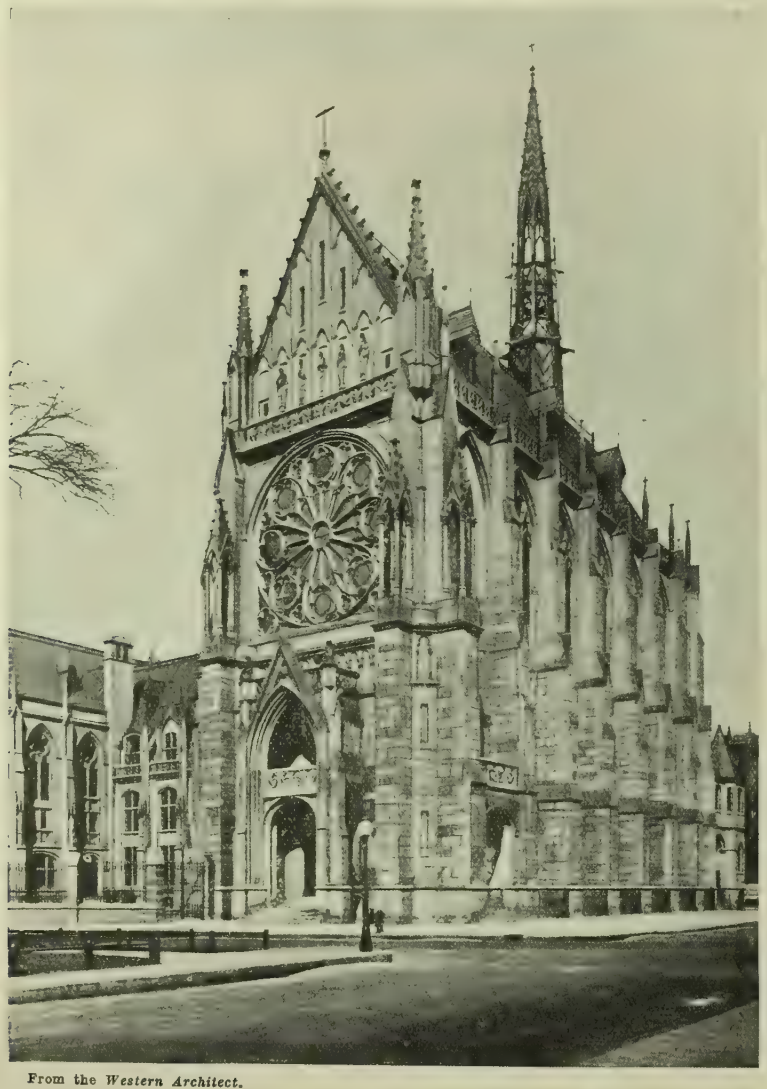
Wilfrid's church was built between *c.* 674-678. It has been described as a building of great splendour, not only through its size and beauty and the skilful design, but also through the wall-paintings that adorned it and the treasures it contained. The church was of stone. Roman stones were used: the site of the ruined Corstopitum (Corbridge) was the nearest and best source of this very suitable and well-prepared material. Like other Saxon churches in England it consisted of a central part with an apse at the east end, the apsidal sanctuary being divided from the central part by an arch; at the west end there was a narthex, or porch. Beneath, there was a crypt, which was a special feature of this building. Ways and stairs led to and from the crypt. From the sides of the body of the church, it is reported, there stood out a number of porches or lateral chambers opening into the central part. The windows were doubtless few and high up in the walls. Conventual buildings also were erected. At the east end of the church, according to the records, there was a graveyard and round t end of the monastery a strong wall of sto There can be no doubt that the church it was built with a view to defence, as a place which people could retire in case of p expecting protection from the sanctity of building as well as from the stoutness of walls.

The monastery itself did not contain a l number of religious. In its shelter there only a small community.

The Eleventh-Century Church.

In *c.* 821 the diocese of Bernicia was joi to that of Lindisfarne. As a result the Hexh bishopric came to an end, and the Bishop Lindisfarne took possession of the lordship Hexham. The monastery there continued, the church ceased to be a cathedral.

For many years in succession after 787, w in the days of King Brehtric, "there first c three ships of Northmen, out of Heretha-l (Denmark)," the north of England especi was a prey to the ravages of the Norsemen. 875, for instance, there was a serious invas in which Hexham was destroyed and the mo killed or scattered. Afterwards probably a set of monks came, but the Benedictine mon tery there, was, it is believed, finally ended in troublous times early in the tenth centu when the Anglo-Saxons were trying to dr back the invading and marauding Danes. 923 there was such a battle at Corbridge. was during these years, when history is eit red with combats or black with obscurity, t such places as Hexham monastery were d troyed. At Hexham the loss was aggrava by the destruction of its library.



For some time Hexham had to look to Chest le-Street and Durham for support. The w at Hexham church was, it is known, carried for a time by a succession of priests fr Durham. During part of the ninth and te centuries, therefore, the see of York, most lik influenced by the troubled state of the count was content to let the control of Hexham p into other hands. It was after William I h subdued the north by a devastation, that w an ugly pattern of thoroughness, that the pri who was then provost appealed not to Durh but to York, which then resumed its sovereign

In 1083 Bishop Carileph of Durham mad reform in the monastery of Durham; he decid to put an end to the system that permit priests to marry. At this time the priest Ei in charge of Hexham, was allowed to end connection with Durham and was given church of Hexham on condition that he restc the buildings. The old church had, as a re of ravages, become thoroughly ruined.

A new church, more parochial than monas was begun at Hexham. It was considera larger than Wilfrid's church, which was t ruined and deserted.

The apse at the east end of the Norm church was built some 20 feet farther than that of its predecessor. The sch included, it is believed, provision for an ap choir, small transepts, and a nave of good The nave was begun, but it is not certain was completed. It is highly probable that nave was not finished. At any rate, it can maintained that a fine new church was be in the then prevailing architectural st Border unrest and frequent inroads by Scots made the work very difficult from t to time. The funds of the church were, m over, in not too satisfactory a condition.

In 1112 Hexham was made, with Holm Yorkshire, the body of a prebend of Y Cathedral. In 1113 Archbishop Thomas lifted Hexham church a good way out o unhappy position by sending to it two canon a reformed type, and by endowing it certain lands, This was the beginning of a community at Hexham, and of a new and hopeful period of its history. The next A bishop (the great Thurstan) further endowe church and placed at the head of the commu one Asketill, an Augustinian canon. Hex now became a house of Austin canons, whi remained till its suppression in 1537. revenues were increased when Archbi

(3) When the Chronicle of Lanercost was written, 1346, the choir and transepts, much as we have them to-day, had been standing for nearly a century and a half. In other words, when this chronicle was composed, the church had already been rebuilt twice.

(4) Whatever view we take of the chronicles, it would seem that one of the determining factors was the use of the church at each time of building. Wilfrid's church was built, so far as can be ascertained, as part of a monastery. The church at once became of cathedral rank. It also served the local population as a parish church. There is no reason to believe that this population was of any great size, cultured and artistic as the people were before the coming of the Danes. No sufficient reason has been brought forward for the comparatively huge nave that has been claimed for Wilfrid's church, a nave that is that of the Norman church.

The second church was built at a time when it was wanted primarily as a parish church, *i.e.*, when a nave would be needed to accommodate the laity as was usual.

When, however, the third church was built, the needs were for a church that was mainly monastic. In this building it was only natural that the canons would spend the best of their energies on their part of the buildings, especially as the transepts proved adequate for the people of this little town, whose population can never have been very great throughout these centuries. The canons, moreover, no doubt regarded the nave as a matter affecting very directly the people, for such was the tradition. They might, for instance, have quoted in this respect an order dated 1286 made by the Archbishop of York to the parishioners, telling them that it was their duty to keep the church, except the chancel, in repair. When we remember, in addition, that the funds of vigour and money of the canons were very limited, we can well appreciate the fact that they failed to build a nave, a failure acknowledged finally by the walling-up of the west tower arch.

(5) The reading of the architectural remains must be allowed its due importance. A certain diversity of opinions is only natural on a subject like this. The reading as done by Mr. C. C. Hodges supports the literal reading of the written authorities mentioned above, but it is here claimed that such an opinion is not supported by everyone; nor, it is claimed, will the ultimate decision of expert opinion fully endorse it. It is believed that the information to be derived from examination of the architectural remains is not only not inconsistent, but actually consonant, with the account given above of the history of Hexham Priory Church and its nave.

LEGAL SECTION

NOTES ON CURRENT CASES

Landlord's Liability in Relation to Flats.

THE recent decision of the Court of Appeal in the case Cockburn *v.* Smith (1924, 2 K.B. 119) is an important one to both landlords and tenants of flats. The plaintiff was the tenant of a flat on the top floor of a block of flats and the defendants were the landlords. Under the tenancy agreement certain obligations were imposed upon the tenant, and there was a clause relating to the landlord's obligation: " Subject to the tenant duly and punctually paying the said rent, and fulfilling all the agreements on her part herein contained, the landlords will keep the entrance hall, staircase, passages, and landings sufficiently lighted and in good repair . . ." There was also a further clause that the landlords should not be responsible for any losses or injuries arising from . . . the negligence or misfeasance of any of the landlord's servants.

In June, 1921, considerable signs of damp appeared in a bedroom, and when paying the rent the plaintiff drew the landlord's attention to this, but they took no steps to ascertain the cause. In the following October there was an escape of water from a gutter in the angle between the plaintiff's flat and the next block, which caused very serious damage to the wall of the dining-room. This was caused by the stop end of the gutter having become corroded and falling out, so that the water fell upon the wall of the dining-room. There was also a fresh outbreak of damp in the bedroom through a gutter having become stopped up. Attention was called to this by the plaintiff over the telephone and also by letter: the letter was not produced at the trial, but verbal evidence was given as to its contents.

The plaintiff remained in occupation, but towards the end of the year developed rheumatism, and in the following March her daughter also developed rheumatism. In January work was commenced on the roof and the gutter was replaced, but the gutter which caused the damp in the bedroom was not cleaned out until the end of the month.

The action was for damages, and the younger plaintiff, the daughter, " an infant," had been made a party.

The Judge in the Court below held that apart from contract it had never been held there was an absolute duty on the landlord to keep in repair, and in this case an obligation could not be implied, for, by the clause we have quoted above the landlord's duty was defined, and therefore the maxim " expressum facit cessare tacitum " applied. In case he was wrong in this finding, and the defendants were under an obligation to the elder plaintiff, the Judge held that the defendants had not taken reasonable care and assessed the damages at £205, but held that in no case could the daughter recover anything because of the decision in Cavalier *v.* Pope, 1906, A.C. 428 (*The Builder*, July 7, 1902). The appeal was only that of the elder plaintiff.

The Court of Appeal reversed the judgment of the Court below, and this question is of such importance we propose to consider the judgments delivered by the three Lords Justices separately.

Lord Justice Bankes was careful to point out that this was not the case of letting of a whole house where, without an express covenant or a statutory obligation to repair, the landlords would clearly be under no liability to repair any part of the premises, but that where a landlord retains part of the premises there is a line of authorities to show that he is under an obligation to take reasonable care that the parts of the premises in his occupation are not in such a condition as to cause damage to other parts demised. The Lord Justice cited three cases where this was implied, though not held, as in those cases no negligence was proved—Carstairs *v.* Taylor, L.R. 6, Ex. 217; Gill *v.* Edouin, 71 and 72 L.T.R. 762, 579; and Ross *v.* Fedden, L.R. 7, Q.B. 661), and then said that the point was definitely decided in Hargroves *v.* Hartopp (1905, 1 K.B. 472, *The Builder*, February 4, 1903), a case the authority of which had been recognised in Cavalier *v.* Pope (*ubi sup*) and in Fairman *v.* Perpetual Investment Building Society (1923 A.C. 428, *The Builder*, March 30, 1923).

Whether this obligation arises out of contract, or whether it is an instance of a duty imposed by law, the Lord Justice did not decide, treating it as immaterial, for there was the finding of negligence which it was impossible to question, for in October the respondents or their agents had notice of the state of the walls calling for immediate attention, and yet nothing was done until February. The Lord Justice said that counsel for the respondent had relied on the fact that the respondents had communicated with a builder, but mere communication is not sufficient; if the builder had taken the work in hand the employer may be excused on the principle of Blake *v.* Woolf (1898 2 Q.B 426), but that case has no application where the builder does nothing. But if the question arose out of contract the Lord Justice held that the finding of the Judge below, that the agreement excluded anything except the matters specially mentioned, on the principle of " expressum facit cessare tacitum," was wrong, for express agreements concerning matters demised or granted do not exclude tacit agreements concerning matters neither demised nor granted, and the roof in this case was neither demised nor granted.

Lord Justice Scrutton held that there was a liability on the landlord at common law. If from an artificial system for collecting water an escape had happened between two adjoining houses, the owner of the house on which the escape of water took place would have been liable under the principle laid down in Rylands *v.* Fletcher (L.R. 3 H.L. 330) for any damage caused. The Lord Justice then pointed out that there are exceptions which modify the rule in Rylands *v.* Fletcher, one of which is where the premises on which an artificial construction is erected, and the premises damaged by the escape of water are in one house, and the construction is erected for the use of both premises, in which case the occupier of the latter premises takes the ordinary risks of damage from escaping water (Gill *v.* Edouin *ubi sup* and Ross *v.* Fedden *ubi sup*), but in this class of case the person who maintains the artificial construction is liable for the consequences of escaping water if, after notice of a defect, he omits to use reasonable care to repair it (Ross *v.* Fedden and Hargroves *v.* Hartopp *ubi sup*).

It is important to note that the Lord Justice in the course of his judgment then pointed out, as we did in our note to Fairman *v.* Perpetual Investment Building Society (March 30, 1923), that since Miller *v.* Handcock (1893 2 Q.B. 177) had been overruled the decision in Hart *v.* Rogers (1916 1 K.B. 646, *The Builder*, March 3, 1916) that there is an absolute duty on the landlord in such cases, and not merely a duty to take reasonable care, is no longer law.

Lord Justice Scrutton reserved the question whether there was a contractual liability arising out of the relation of landlord and tenant.

Lord Justice Sargant also did not decide whether the landlord's duty is founded on some implied covenant or obligation in the contract of tenancy, or from the circumstances of the landlord retaining physical possession of the roof, in law, but adopting the view that was an implied contract he held, as had Justice Bankes, that the Judge in the Court was wrong in holding that expressed st tions as to the part demised displaced th plied contract relating to the portion re by the landlord, and he held Hargro Hartopp to be a direct authority in fav the plaintiff in this case.

The decision is of extreme importance has disposed of the difficulty we have referred to in these pages of recor Higgins *v.* Miller and Hart *v.* Rogers other decided cases.

In Fairman's case the plaintiff wa sister-in-law of the tenant and, therefore an invitee to whom the landlord would different degree of care, being a stranger contract, but in our note on that case w sidered the effect of the decision of the of Lords as it would bear upon a tenan we pointed out that the law seemed co defined in Dunster *v.* Hollis (1918 2 1143, *The Builder*, February 21, 1919), be that where a landlord lets portion building to a tenant, but retains cont material portions himself, he must take r able care to keep the portions remaining control in repair, an obligation whi implied.

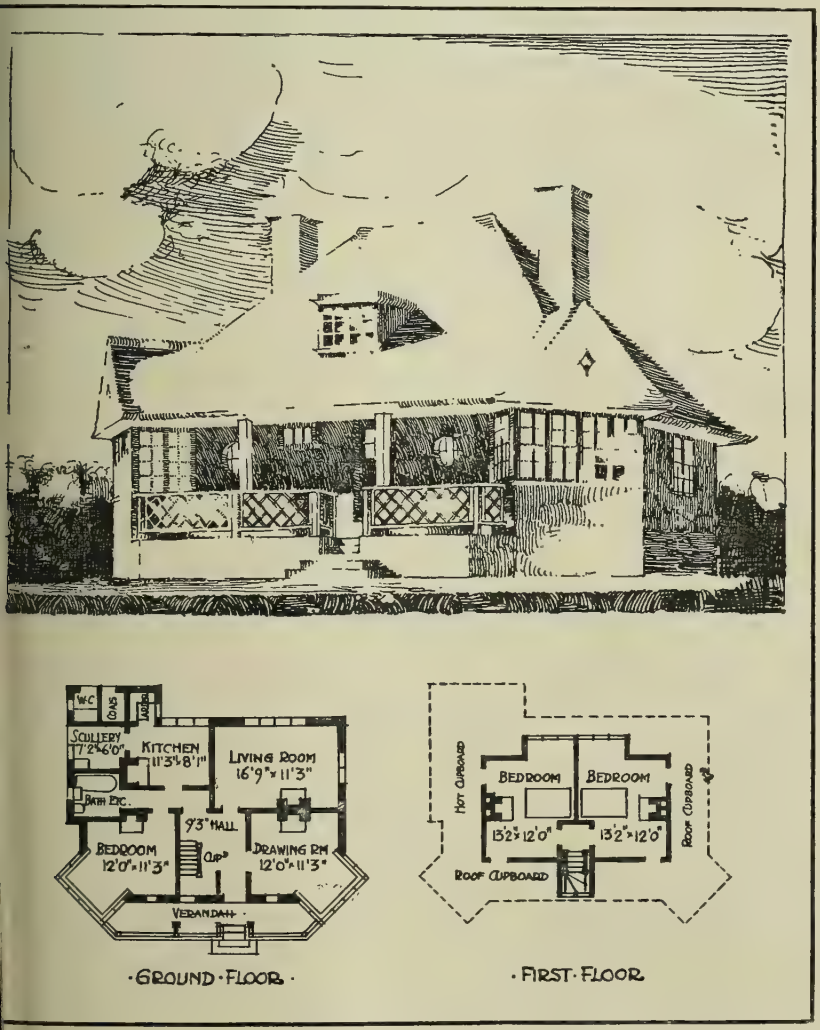
That seems to be the exact effect judgments we have been considering, all such cases provided that notice of the is given to the landlord.

Rent Restriction: Landlord Liable for Repair.

The case Bourne *v.* Litton, which we noted April 18, is now fully reported Law Reports (1924 2 K.B. 10), and raises points of considerable importan landlords we revert to it. There were complicated features in the case, and notices to increase the rent had been but from the report of the case available in the Court of Appeal, it a that the case may simply be treated as the point: What is the right procedure landlord to adopt when he is liable fo only and not the whole of the repairs?

By section 2 subsection (1) (*d*) of th Act, 1920, it is provided (in addition t amounts allowed as increases by the s that (i) where the landlord is resp for the whole of the repairs an amount ceeding 25 per cent. of the net rent r claimed or (ii) where the landlord is sible for part, and not the whole, of the such lesser amount as may be agreed may, on the application of the landlord tenant be determined by the County C be fair and reasonable, having regard liability.

The plaintiff, the landlord, was cl possession of the house on the ground t rent was in arrear by £33 5s., and profits at the rate of £133 per annum defendant, the tenant, had originally tenant on June 8, 1917, for one year at of £120, with an option to contin tenancy for three years from Septem 1918 at a rental of £105. This option h exercised and the tenancy extended tember 29, 1922. The plaintiff had pu the house by contract dated July 27, 19 the property had been duly conveyed on August 8, 1922. After the plaintiff tract had purchased the house he ha certain notices to increase the rent. only notice material to the point we sidering was a notice of August 24 claiming 15 per cent. increase under s subsection (1) (*c*), which was not in q and a further increase of 15 per cen subsection (1) (*d*) as to which the pc raised that, as the landlord was not res for the whole of the repairs, this increa



r be agreed or submitted to the County t for assessment. In the case it attempted to make out that certain corredence amounted to agreement, but the rity of the Court of Appeal did not take view, and it must also be noted that the t of Appeal treated the case as one where tenant undertook certain repairs and the ord the rest, but that the extent and proon of the repairs was not entered into, the case only indicates the proper pro-re to be adopted where under subsection (*d*) the landlord is responsible for only of the repairs.

e majority of the Court of Appeal held the action failed because the notice of ine in question was bad because, under on 3 subsection (2) no increase is due or erable until the expiry of a valid notice e form given in the Act, and that form r heading (*d*) in the schedule requires sum claimed to be set out with particu- and, therefore, the amount cannot be in unless either a sum has been agreed, ttled by the County Court in accordance subsection (1) (*d*), and the note contained e form in the schedule.

rd Justice Sargant is reported as having red the decision arrived at by the majority e Court because, in his opinion, it places ddditional and illogical obstacle in the way landlord seeking to make a perfectly just ion to rent in respect of the increased cost of repairs. The decision places landlords in a difficult position in several ways. If it stands good since the Act of 1923, then, however small may be the repair undertaken by the tenant, the procedure indicated would have to be followed before an increase of rent could be claimed, either the amount be agreed or determined by the County Court. If the question is determined by the County Court, probably the decision is final under section 2 subsection (6).

Lord Justice Bankes reserved the question whether having regard to this latter subsection the High Court had any jurisdiction to entertain the question at all. But it is still more important to observe that Lord Justice Scrutton pointed out that this case was being decided under the Act of 1920, but the powers given under the Rent Act, 1923, in section 6 to amend notices of increase, and in section 11 to determine the increase of rent, permitted under the Rent Act, 1920, or the Act of 1923, might lead to a different result.

Therefore it appears that in such cases where the landlord is only liable for part of the repairs he must either take the course indicated in this case, agree the amount, or have it settled by the County Court before giving the statutory notice of increase, or under section 11 of the Act of 1923 apply to the County Court summarily to have the permitted increase determined.

House at Brentwood.

MR. HUBERT V. C. CURTIS, Architect.

esigning this house the "bungalow" type dopted in preference to a loftier building g regard to its elevated site and the ne of the adjoining houses. Built of work, most of the external walls have a cavity, and are plastered and colourd outside above the plinth, which is tarred. The roof is covered with boards, felt and large red clayburnt tiles. Window frames and sashes are of wood; verandah posts and balustrading are of local oak. The site is on the Brook-street Hill Estate at Brentwood. Mr. Hubert V. C. Curtis, of 27, Essex-street, W.C., is the architect.]

THE LAW AND PRACTICE OF TOWN PLANNING*

THE authors of this work, in the preface, point out that town planning is not only from a legislative view a new subject, but that so far as the making of schemes is concerned it is still an adolescent one. All the schemes made up to now and every scheme about to be made contain special provisions, but experience has enabled the central authority to frame model clauses which were issued last February, which, in future, will no doubt be consulted in the framing of future schemes, and to a large extent be incorporated in them, although they need not be slavishly followed, and these model clauses, together with the model forms and other matter, will be found in the appendices to this volume. The authors also point out in their preface that town planning is a subject which is of national importance in the eyes of the Legislature, as it will be practically compulsory within six years of January 1, 1923, for the councils of all boroughs, and of all other urban districts with populations exceeding 20,000, to submit schemes in respect of all land within their areas to which town-planning schemes may be made.

This volume, besides the tables of statutes, table of cases, and an index occupying some 40 pages, consists with the appendices of 267 very clearly printed pages of text, and there is a chapter dealing with the compulsory acquisition of land, which the authors state they have treated at some length because, although this is applicable to other objects than town planning, there are many new provisions respecting the procedure to be followed in the acquisition of land by local authorities which appear not to have been exhaustively dealt with in cognate works.

Authors treating upon the subjects of housing and town planning are severely handicapped by the complexity of the legislation, which it will be remembered Sir Kingsley Wood characterised as "voluminous and almost chaotic," and although so far as town planning is concerned the statutes, as the authors observe, do not occupy a great space, the subject is one of considerable magnitude, because the Minister of Health and the local authorities have been left to formulate the schemes. In judging of works dealing with this subject, it has to be borne in mind that the method of legislation renders a great number of cross references unavoidable, and a straightforward narrative cannot be expected, but so far as we have examined the text the authors appear to have dealt with a complex subject as lucidly as possible, and the table of cases will show that wherever it has been possible authority is given for the propositions put forward, but as is pointed out in the preface the subject matter being to a large extent "virgin soil," on some points they have had to express their own opinions.

We notice it is stated in Chapter XI, on the "Compulsory Submission of Schemes before 1929," that the regulations to be made by the Minister of Health under section 46 of the Town-Planning Act, 1919, have not yet been made, and it is suggested that, in order to enable the councils affected to perform their duty within the prescribed period, their issue should not long be delayed, since the Ministry of Health (Town Planning) Regulations, 1921, which deal with voluntary resolutions seem hardly applicable to these compulsory schemes.

The work appears to us to have been carefully done, and this volume should prove an extremely serviceable handbook.

* "The Law and Practice of Town Planning." By Sydney Davey, M.A., LL.B. (Barrister-at-Law), and Francis C. Minshull, L.L.M. (Chief Assistant Solicitor to the Corporation of Birmingham). (London: Butterworth & Co., 1923). 25s. net.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

**** *We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

The Possible House.

SIR,—One hears a great deal at different times about the practicability of erecting smaller houses to suit the artisan, or bungalows adaptable for rural districts, without the utilisation of bricks, except perhaps for the chimneys or floors.

It is said that houses of a "standard type" are supplied by some London and Liverpool firm, and, if so, does the Ministry of Health give their support to them, or does the Ministry allow the local authority full powers as to the construction?

Would not it be practicable, by the use of some waterproofed lining material, to do away with the ordinary lathing and plastering?

The material might be light, but there might be a necessity for adopting a substance that is proof from decay, such as wet or dry-rot, and it seems desirable that the material should be vermin-proof.

The floors, too, if made of concrete, would require some durable covering, and for sake of appearance should have a little warmth or mellowness about them. Can this be obtained?

It may be that some firm undertaking this kind of work would furnish one with particulars, and indicate if floors were of brick or tiles, and if there exists some effective material for laying thereon, to overcome any unevenness of surface. The expense of old "pre-war" ways seems beyond many people's purses.

One wishes to get the walls to be warm, at least to the touch, and not subject to the nuisance of "sweating"—something antiseptic and hygienic.

One, by having data before building, may save a client much disappointment, and I should appreciate news from those who have such experience at their finger-ends and special knowledge.

I think the subject is one that concerns a rather large class who require a healthy but a moderately inexpensive home to-day.

EDWARD A. JOLLYE, A.R.I.B.A

Artificial Daylight.

[REPLY TO DESIGNER.]

SIR,—Artificial daylight may be produced by means of the Dufton-Gardiner lamp, in which the light from the arc lamp is filtered through special tinted glass, or by the Sheringham daylight system in which the light is either reflected from a specially coloured surface or transmitted through tinted glass.

Either system has been found very satisfactory.

"K. W."

Drainage.

[REPLY TO MR. J. E. TUKE.]

SIR,—It would be foolish indeed to cross swords with such an authority as Mr. Tuke upon his own subject of sewage disposal, and I do not propose to do so, particularly as the statements in his letter in your columns were so patently correct.

I should, however, be glad of an opportunity of making myself a little clearer, and at the same time expressing my gratitude to Mr. Tuke for exposing the ambiguity of my statements, as I can now see they might very well be read.

In referring to a septic tank system I intended to refer to the whole system of septic tank, filter bed and disposal of effluent; the disposal of effluent will be practically pure from a properly designed system, though not the effluent from the septic tank itself. I am well aware that the latter effluent is merely brought to a state in which aerobic bacterial action may take place in the filter beds, and is not by any means pure.

Finally, I laid stress upon the construction of the septic tank because I have found from experience that the average builder fails here, more than anywhere else, when he professes to construct such a system. He generally makes this chamber far too big, and rarely provides the dip pipes, so that the sewage is continually flopping on the surface, preventing the formation of the scum, which means that bacterial action is not set up, and an effluent is discharged that is quite unready for the filter beds. I think that when the proper construction of this chamber is assured more than half the battle is won, whatever the scientific relative importance of the parts of the system may be.

"SANITARY."

Scaling of Roof Tiles.

SIR,—I have recently been called in to inspect a roof in which the tiles, of a hard machine-made type, are scaling off at the surface in an alarming manner. At present, however, I can find no signs of the weather coming through, though I was there during a very wet spell.

Would any of your readers advise me whether such a roof is likely to remain weather-tight, or, if not, whether there is an inexpensive treatment by which the trouble may be arrested in time?

"ARCHITECT."

Old Oak Timbers.

[REPLY TO MR. T. M. COUZENS.]

SIR,—In answer to this inquiry in your issue of August 22, the best method in my experience is to give the oak a thick coat of fresh lime put on in a paste form with a trowel. This is to obtain an old silvery tone. If to obtain a dark brown tone give the oak a thick coat of fresh Portland cement in paste form. Whichever is done, leave for forty-eight hours, and then carefully scrape off and brush down with a stiff brush. You can also obtain a very nice rich brown by giving the oak two coats of double strength ammonia. If, however, you have any sappy places you can generally touch them up with a little of Mander's dark oak Matsine and turpentine, after applying the ammonia.

H. A. CUMMINS.

SIR,—A solution of sulphate of iron $\frac{1}{8}$ to $\frac{1}{4}$ oz. to 1 gallon of water, applied with a clean brush, will darken the oak, the action being on the tannin contained in the oak. It is advisable to try the strength on a spare piece of oak and regulate to the required depth. The blue tint will darken down in a few days as ink dries black. A coating of raw linseed oil fourteen days after staining will bring out the brown of the oak if desired. A limewash coating instead of the oil (the lime to be subsequently brushed off) will make for an antique finish.

"W. C. R."

Distemper and Asphalte.

SIR,—We have recently covered a flat roof with mastic asphalte and during the hot weather the lantern lights were coated with a distemper as used for greenhouses.

Since the rains of August the distemper has washed off and the drippings have caused small blisters in the asphalte. Where some was spilt when being applied there is a similar blister.

Can you say, please, if this should have happened, and how it can be prevented in the future?

"CITY."

Claim for Subsidy.

SIR,—We undertook a direct contract for a firm of land agents to erect a dwelling house at £550, and have reason to believe that they claim the Government subsidy on same. however, are led to believe that the subsid due to us as the builders and contract We wrote the Ministry of Health some e days back, but have received no reply to d and should now greatly value your estee opinion as to our position.

"F. G. C."

[The Housing Act stipulates that claims subsidy must be made before building c mences, and that subject to certain condit having been complied with the claimant be paid on completion.

They should be "the builders" of the ho but the term does not necessarily signify contractors, but the person, firm or body causes the house to be built and finances operation. In this case the employers u an ordinary building contract would be q justified in making application for the subs and receiving the preliminary certifica which entitle them to the subsidy on the completion of the buildings (and this sub will only be paid to the holder of this certific which cannot be transferred, except by pri arrangement, for which provision may h been made.

If, however, as appears to be the case h a contract has been entered into under a understanding, it would be well to appro the employers with a view to rectification withdrawal from the contract. If this is granted it would be well to seek legal advic to whether the terms of the contract can read to imply the receipt of the subsidy amo by the contractors.

In any case it must be understood that mere fact of being the contractors does carry with it the right to the subsidy as fa the local authorities are concerned.]

Laying of Bricks.

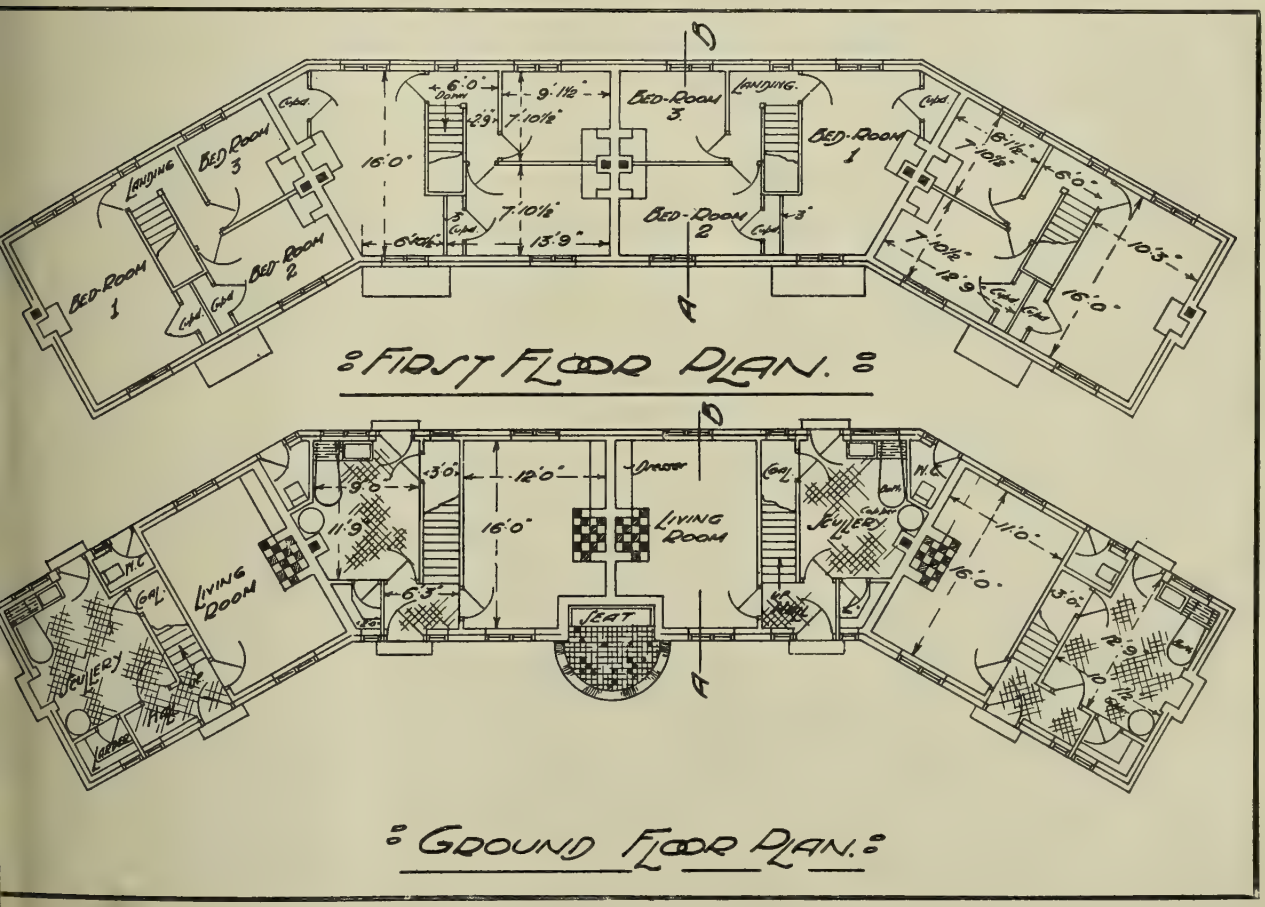
[REPLY TO MR. V. J. WENNING.]

SIR,—Does your correspondent, Mr. V. Wenning, appreciate the fact that bricks nominally 9 in. × 4½ × 3 in., and when laid require two rows (disregarding bond), laid on edge would require THREE ROWS? A example, a wall 9 ft. long, 9 in. thick, 21 ft. high, would require the following num of bricks: Laid flat—12 (in 9 ft. length) (thickness of wall) ×84 (number of course 2,016 bricks. Laid on edge—12 × 3 × 5 2,016 bricks. Therefore there would be saving of either material or labour, if laid edge, as against laid flat.

There might be a small saving on poin externally. Doubtless a contractor or bi maker would give your correspondent scientific reason for laying bricks, as they h been laid for centuries.

A. E. FLOWE

SIR,—The inquiry appearing in your issu August 22, page 291, under the heading, "I ing of Bricks," reminds me that, whilst t my holidays at Beer, Devon, last July, I a precisely similar query put to me by a l builder, who was putting up six-roomed cott in pairs, which had been passed by the l authority (the Axminster Rural District Cou as qualifying for the subsidy. Upon going the matter, as a kind of busman's holi on my part, we came to the same conclu as stated by your inquirer, with regard to saving which could be effected by laying bricks on edge and with a 3 in. cavity.



But the Surveyor to the Council decline accept outer or even party walls constru in that way, on the grounds that it was n recognised method of construction, and unknown to him. Doubtless the official acting within his rights and powers.

Nevertheless, the method was mentione evidence before the Departmental Comm appointed by the President of the then L Government Board, and was referred to in Report, as a method of cheapening the co erection.

Therefore, I echo your inquirer's "(not?"

THE BUILDING TRADE

ESTIMATING FOR SMALL BUILDERS

By J. H. BARNS, F.I.O.B.

PAINTING.

The cost of painting materials per yard super will depend in a measure upon the density of the paint, as a very thin paint containing very little body or white lead would cover a very much larger area than a thicker paint with greater properties of opacity or obliteration. Thin paint would not sufficiently blot out the colour of the undercoats.

It is sometimes stated that each coat of paint should be of a different and distinctive colour, so that the number of coats may be checked. This may give a very diverse effect.

The cost of labour to painting will very largely depend upon the quality of the work to be done, and may vary from 3d. to 9d. per yard super for brush work.

The difference in the cost is largely caused by greater time which may be spent in rubbing down and preparing the surfaces for the succeeding coats.

Paint spraying by air pressure is hardly suitable for general builders' work.

The price of painting materials fluctuates.

OILS AND COLOURS, &c.

The price of turpentine is now high and would be very much higher were it not for the large quantity of turpentine substitutes used. As can be seen from the list of prices appended there are several grades of American spirits of turpentine. There is no point in paying a high price for American spirits of turpentine unless you can get a certificate of distillation with your purchase. The spirit should comply with the Government specification.

The value of turpentine is as a solvent and a thinner of paint. The spirits usually contain a small percentage of resinous substance. When used in paint the spirit evaporates and the resinous substance forms a film, and this may not dry quickly, so that the surface may be dry and the undercoat wet, thus creating a condition likely to cause blisters. Turpentine substitutes have now been on the market for about thirty years, and they can fairly claim to have established their position, and were largely used by the Government and others during the war. Turpentine substitute is usually a white spirit with a petroleum base. The odour seems to depend in a measure upon where the petroleum comes from. It is said that a Roumanian oil gives off the least smell, but some of the American product gives off a strong smell.

Substitutes can be prepared to suit any specification or similar specification to genuine turpentine, as to flash point, distillation and percentages of residue of hydro carbon. There is still a prejudice in some quarters against the use of substitutes, but the small builder would be well advised to try some of the substitutes advertised in *The Builder* upon unimportant work, carefully watch the result, and form his opinion therefrom. The prices for the best substitutes are about half the cost of genuine American spirits of turpentine. Linseed oil substitute has usually a soapy base, and being a purely chemical product can hardly be recommended.

GENUINE STACK MADE WHITE LEAD GROUND IN GENUINE REFINED LINSEED OIL.

Yellow Ochre	38/– to 54/–

If packed in 7 lb. tins, about 10s. per cwt. extra.

The cost of these materials will depend on the power of the stainers, &c.

VARNISH.

Varnish is manufactured from turpentine or turpentine substitute, say, 35 per cent.; and the remainder in equal parts of linseed oil and shellac or copal gum. This will give you some idea of the cost.

The dirt or dross in the gum takes a long t to settle, so it is usual to let varnish ma some time before use.

	Gal
Pale Oak Varnish, for inside or outside use ..	from 1

do., do., transferred „ „	7
do., Foreign, 3¼ in. .. „ „	5
do., do., transferred „ „	6

The kegs or cans containing the materi mentioned above are usually charged for a credited on their return.

—Yards super. knotting, stopping, primi and painting three oils, in addition to pl surfaces.

Knotting is the first operation, and usua applied in the form of shellac varnish, a the quantity required will of course depend the number of knots to be covered.

Priming is the first coat of paint and, togetl with the three oils mentioned, would ma four coats in all.

The stopping is done after the priming co as otherwise the oil in the putty would absorbed in the wood and the stopping beco loose.

The quantity of materials required will depe upon the density or otherwise of the paint u as mentioned above.

The following is a fair average of the paint materials required :—

To cover 100 yds. super, one coat—

16 lbs. Ground White Lead, 70/– cwt. ..	10 0
½ Gallon Linseed Oil, 3/9 ..	1 11
¼ Gallon Turpentine, 7/– ..	1 9
¼ lb. Dryers, say ..	0 2
Glass Paper ..	0 6
	14 4

The cost of stainers which may be required not separately included, as they would proba take the place of White Lead at a cost depend upon the colour chosen.

Common colours are about the same price white lead, except the dark colours, which usually cheaper.

The quantity of white lead used may v from 11 lbs. to 17 lbs. per 100 yds. su of surface covered, thus priming may take 15 first coat, 19 lbs. second coat, 14 lbs., and so with a probable average of 16 lbs. weigh

Very few persons will be found to agree these quantities, and it is as well for the s builder to keep a record of the material u on each job, and work out for himself the aver quantity of material required per 100 yds.

Example.

Per 100 yds. super. painting as described ab

rd to the antiquity of waterworks,
e ruins of hydraulic works in Egypt
d at least 2,000 years before Christ.
the great Roman aqueducts dated
126 to 312 years before Christ, and
11 to 61 miles in length. Those great works of antiquity were constructed without the aid of steam, electricity, or explosives—truly a wonderful example of human ingenuity and perseverance. In regard to more recent times, all Londoners owed a tribute to the memory of that great citizen, Sir Hugh Myddleton, who brought the New River to London over 300 years ago.

Speaking of the London water supply, the lecturer said, if they started to walk at the rate of three miles an hour along their miles of water-pipes, it would take them three months of continuous walking to complete their journey. There was enough water in their gigantic storage reservoirs to give the whole world a drink of a gallon of water per person for seven days. Further, their daily supply was sufficient to give every man, woman, and child in Great Britain a daily supply of six gallons per head.

Dealing with the question of purifying water, he thought pride of place ought to be given to the slow filtration method practised by the old London water companies. By this process water was purified by filtering it through about three feet of fine sand at the exceedingly slow rate of less than two gallons per square foot per hour. Literally, the water crept through the sand so slowly that all the impurities were satisfactorily removed. Chlorination as a means of purifying water was first used in 1905 in fighting a serious typhoid epidemic. In the Great War chlorine was used most successfully by Horrocks and his colleagues in purifying the water for the troops. In the United States the great majority of water supplies were chlorinated, and the death-rate from typhoid fever has been reduced to a remarkable extent.

In regard to the romance of water supply, concluded Sir Alexander, if they turned on a tap, the water flowed, but they could not see the little army of men working in their interests; they could not hear the hum of the mighty engines contributing to their comfort. Perhaps the water came from a deep well; it might be sweating through the pores of rock of bygone ages. Possibly it came from the moorlands; was it a frolic of the imagination that it carried with it some of the sweetness of their beloved uplands and mountains? The eagle, the ptarmigan, the grouse, the curlew, and the plover, the speckled trout, and the glory of purple heather—those were some of the things that leaped to the imagination. Their water-supply came from rivers—but what rivers? The New River of immortal fame; the Lee, carrying with it the undying memory of Izaak Walton, the most beloved of all anglers; the Thames, linking them with the commerce of the wide world, wending its tortuous way to the sea through scenes of unsurpassable beauty and speaking of historical associations of amazing interest and importance.

On the motion of Miss P. Fawcett, Assistant Education Officer of the London County Council, seconded by Mr. A. R. Sage, M.B.E., the Principal of the School, a vote of thanks was accorded to Sir Alexander Houston.

Building Contracts and Councillors.

Members of Bath firms which have been converted into companies, whose members are also members of the City Council, have decided that no further orders are to be executed for the Town Clerk's Department. This decision was arrived at in consequence of the recent case at Hull, when it was decided that directors of companies contracting for Corporations were disqualified from office on their local councils.

New Dock at Bromborough.

Tenders have been invited by Messrs. Lever Bros., Ltd., for the construction of the company's new dock at Bromborough Pool, for which they obtained Parliamentary sanction some time ago. According to the estimate given during the Parliamentary proceedings, the constructional work will cost about £700,000 but to this must be added the cost of buildings and machinery, bringing the total amount up to approximately £1,000,000. It is estimated the work will take three years to complete.

SETTLEMENT OF THE BUILDING DISPUTE

After a combined strike and lock-out of seven weeks' duration, the employers and operatives' representatives agreed on Friday last week to the following terms of settlement :—

Wages.—That the wages of all craftsmen and labourers be advanced one-halfpenny per hour under clause 14 (*c*) of Agreement II of the Constitution, such increased rate to be stabilised until February 1, 1926. The said rate to come into operation immediately on resumption of work, except as hereinafter provided :—Towns which have received one penny and upwards by upgrading since September 26, 1923, to receive the above advance of one-halfpenny as and from October 1, 1924.

Regrading Applications.—Applications for regrading which are ordinarily due for October, 1924, shall be suspended until October, 1925, Applications due to be heard for July statutory meeting, 1924, to be dealt with.

Hours of Labour.—That the working hours shall be dealt with forthwith as outlined in circular issued on June 16, 1924 (attached hereto)* But in any event (other than in those localities that have agreed to vary the hours by mutual consent under the terms of the constitution) the summer working hours shall be 46½ per week as and from the commencement of official summer time, 1925.

Time Lost.—A joint committee of 12 members to be appointed by the employers and a similar number by the operatives be set up to consider same. The following to be the terms of reference :—

"To inquire into the causes and circumstances of the incidence of time lost through inclement weather in the building industry and to report on the facts in connection therewith, together with such recommendations as the committee deem desirable in regard to same. Such inquiry to be held at an early date and endeavour to report within six months from date of this agreement."

London Position.—That the position of London in regard to the operatives' demand be made the subject of local inquiry and negotiation on its merits, with a view of reaching an agreed solution, subject to the approval of the National Wages and Conditions Council.

Liverpool.—The Liverpool, &c., operatives to agree that they will accept agreed national machinery for fixing wages and conditions if and when accepted by both national bodies after it has been submitted to a national vote of both sides, subject to the following :—

(1) A local agreement to be binding until December 1, 1925.

(2) Wages and Conditions (except Rules 14 and 15, which are to be eliminated) to be the same as prior to the dispute until December 1, 1925, but no alteration to take place in wages and tool money until February 1, 1926, in the event of national machinery not being in existence on December 1, 1925, a local agreement to continue until such machinery is set up.

(3) All wages in Liverpool, &c., to be the same as other Grade A towns as and from February 1, 1926.

(4) All national rules and conditions (other than wages) to be operative in Liverpool, &c., as and from December 1, 1925.

---

* [The circular of June 16, referred to in the paragraph above, "Hours of Labour," contains the following clause :—

It is necessary that the disagreements with regard to the summer working hours should be settled without further delay. The joint negotiating committee therefore requests that where there are differences still outstanding the local employers and operatives meet within seven days to consider same. Failing agreement, Clause 1 of the National Working Rule Agreement as to summer hours shall become operative.]

Consequential Alterations to National Wages and Conditions Machinery.—Pursuant to the terms of Article 6 of this Agreement, and dealing with the consequential amendments, it shall be an instruction that such alterations or modifications shall aim at giving greater power to the joint regional wages committees to deal with such matters as are capable of regional settlement, subject to the approval of the National Wages and Conditions Council. Any amendment to be completed at the latest by the statutory meeting in July, 1925.

Resumption of Work.—It is agreed that work shall be resumed on August 25, 1924; that, as far as practicable, the employers will reinstate their former employees and workmen will return to their former employers; that there shall be no victimisation on the part of either side in consequence of anything arising out of, or in connection with, the dispute, and that no influence will be exerted by either side which may prevent a mutual renewal of former relationships between employers and workmen.

NEW BUILDINGS IN LONDON

Edgware Parade.—Immediately adjoining the Tube Station in Hale-lane. It is of Georgian character, with pilasters of stone running up to the second floor. The two centre shops have a Georgian pediment of stone, and the shops, which are placed three from each end, have a similar treatment. The stone is being supplied by Messrs. the Empire Stone Co., Stroud. The outer walls are of multi-coloured facing bricks supplied by Messrs. Thos. Lawrence & Sons, of Bracknell, and the roofs are tiled with tiles supplied by the same firm. The two shops with the pediments have a frontage of 24 ft. each, and the remainder 20 ft. The architect is Mr. James A. Webb, of Stanmore. The first section of the Terrace is now practically completed, and when this has been accomplished a further terrace will be erected, and already the corner site has been acquired by the National Provincial and Union Bank, who are under contract to build premises to harmonise with Premier Parade.

London Bridge.

Mr. C. M. Topping, who is described as a tugmaster, recently stated in a letter to the Press:—"Now that Westminster Bridge is to be tested, I feel that the authorities should know that the east side of the south pier of London Bridge's middle arch has dropped 3 to 4 in. below the level of the west side. This is similar to what occurred before Waterloo Bridge broke its back, and seems to show that a survey is needed. I noticed the difference in levels when passing under London Bridge at high water. I may add that I have been passing under the bridges of London in the course of my work for the past 24 years." Inquiries at the Guildhall, however, showed the officials to be somewhat sceptical, although Mr. Sydney Perks, the City Surveyor, later paid a personal visit to the bridge, and his investigation will be published in an official report.

Builders' Estates.

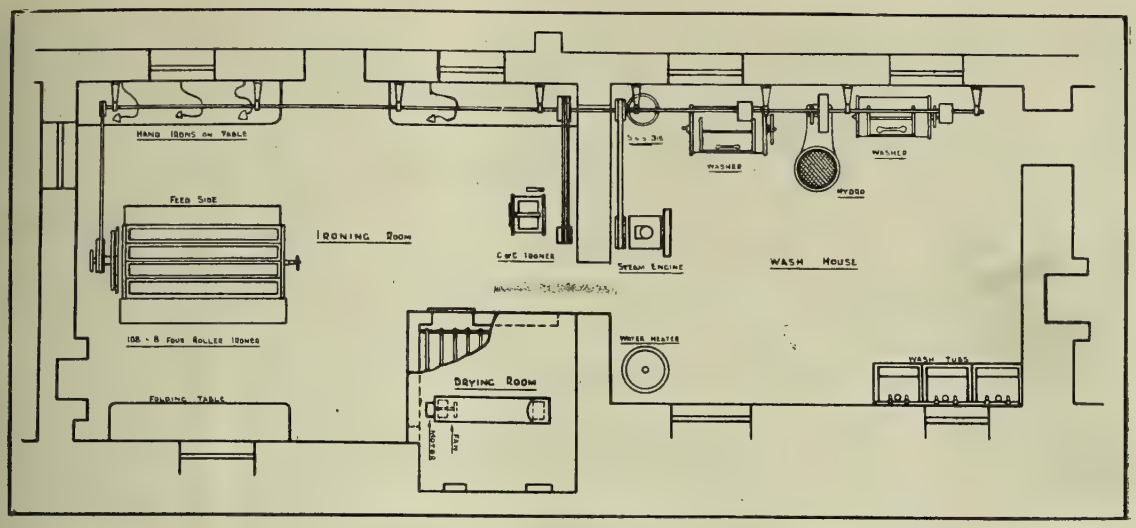
Mr. George Garton, of Lloyds Bank House, Albert-road, Saltaire, Yorkshire, builder, gross £14,042.

Mr. William Jones, of Breckside Park, Liverpool, builder (net personalty, £3,386), £24,564.

Mr. John Laing, of the Scaur, Carlisle, retired builder and contractor (net personalty, £4,480), £16,535.

BUILDING TRADE WAGES

THE table on this page shows the alterations according to the agreement reached last week.



It is reported that certain sections of the operatives in London and a few other places are dissatisfied with the settlement, and have not yet returned to work.

RATES OF WAGES IN THE BUILDING TR

The following are the rates of wages in the building trade in England and Wal endeavour is made to ensure accuracy, but we cannot be responsible for errors that may

PLAN

ODEL LAUNDRY AT TAYMOUTH CASTLE

YMOUTH CASTLE, the late residence of the quis of Breadalbane, and situated at the of Loch Tay, has now been converted a hydropathic hotel. The architectural res of the historic building have been ned as far as possible, but certain innova-, such as electric lighting, heating, cook- and laundry plant, had to be installed neet the requirements of the converted olishment.

e steam laundry is located at the back of house, alongside the power station and ges, and can be reached from any part ne house by means of corridors without outside. The steam supply is taken the central boiler house adjoining to a cal steam engine of 10 b.h.p., which is ble of driving the complete laundry in-ation. The exhaust steam from this ne is taken first to the hot-water tank a yards distant, where it passes through a er coil and provides a constant supply of water for the two washing machines and sinks. From that point it is further utilised for heating the boiler feed water and thence to atmosphere. A regular practice in outfits of this kind is to utilise the exhaust steam for heating the drying closet as well, but at Taymouth Castle the intention is to use the drying chamber for other purposes than laundry work, such, for example, as drying wet clothes belonging to the guests. For that reason the chamber would often require to be in a heated condition when the laundry engine was off and no exhaust steam available, so that a live steam connection has been introduced to overcome that difficulty.

For washing the blankets and linen there are two all-metal belt-driven machines, one having a brass inside cylinder 28 in. diameter by 48 in. long, with capacity equal to 120 shirts per load, and a smaller machine having a brass sheet, 24 in. diameter by 48 in. long, with a capacity of 80 shirts per load.

The washing of a load occupies about 45 minutes, so that, allowing for the time occupied by handling, six loads can be put through each machine per day. The hydro extractor (shown in the illustration), placed alongside the washing machine, takes the load of wet linen as it comes from the washing machine and extracts all the water from it by centrifugal action. The load is placed in the inner revolving basket of the machine, which attains a speed of 1,700 revolutions per minute, causing the load to cling to the sides. When the operation is finished at the end of 15 minutes the mass of linen is in a damp state, and is then ready for the drying chamber or to go straight through the calandering machine. The third unit in the plant is the drying chamber, which is a brick-built compartment, 9 ft. 6 in. by 8 ft. 3 in., with a sliding iron door. Near the roof of the chamber a series of rods is fixed, on which the goods to be dried are hung.

Hot air is introduced into the chamber from lengths of steel-gilled pipe placed on the floor along the sides of the chamber, so that it rises to the hanging clothes and dries them off at a temperature of about 120 deg. To assist them in the drying process a motor-driven fan is fitted inside, which has the effect not only of distributing the hot air, but of keeping it changed and preventing humidity.

The architect was Mr. A. Balfour, of Glasgow, and the contractors Messrs. D. & J. Tullis, Ltd., of Clydebank.

PART OF WASHHOUSE.

IRONING AND FINISHING MACHINE.

Model Laundry at Taymouth Castle.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

AUGUST 30.—**Annfield Plain.**—WAR MEMORIAL.—Prices and designs for erection of war memorial in the Annfield Plain Park between £250 and £400. Hon. Secretaries, Council Offices, Annfield Plain.

AUGUST 30.—**Bakewell.**—CONVENIENCES.—For the erection of public conveniences, for the U.D.C. Mr. T. W. Newbold, architect, 70, Surrey-street, Sheffield.

Hunter; bungalow, Mavis-road, for Mr. Grinshaw; two houses, St. Ledger-road, for Mr. J. Elkins.

BUCKTON.—Funds are being raised by the Rev. Father Newton and the Catholic congregation for the erection of the proposed Fitzherbert Memorial Hall on a site situated in Bristol-road.

BURNLEY.—A site is to be secured in the Palace House district for the erection of a new central school by the E.C. The R.D.C. has approved a plan for an extension at St. Nicholas' Church School, Sabden, and also proposes to purchase 150 sq. yds. of land for the purpose of widening and improving the highway at Pike Hill, Worsthorne.

CASTLEDERG.—Mr. A. V. Ashe, Inspector of the Ministry of Home Affairs for Northern Ireland, has conducted an inquiry into a scheme under the Labourers Acts, promoted by Castlederg R.D.C. The estimated cost of the new scheme was £18,550, and it was proposed to erect 53 new houses.

CHALLON KINGS.—The R.D.C. has approved plans for a bungalow in Lyefield-road, for Mr. Cleveley, and a bungalow in Hamilton-street, for Canon Burton.

CHEADLE.—The D.C. has received sanction to subsidise a further 100 houses to be erected by private enterprise. The plan for extension to the cemetery has been approved.

CHEPSTOW.—The U.D.C. is to acquire land to proceed with the St. Lawrence-road improvement scheme, estimated to cost £12,000.

CHESHIRE.—The C.C. proposes the widening of Backford canal bridge, at a cost of £5,685, and widening portions of the Chester-Birkenhead road at a cost of £11,700.

CLEVELEYS.—Plans have been approved by the Thornton Council for the following new buildings: Two houses and shops in Beech-road, for Holt & Dawson, and also two further houses for the same firm; pair of bungalows in St. George's-avenue, for R. Lancaster & Sons; bungalow in St. David's-road for the same firm.

CLITHEROE.—The Borough Surveyor has been granted £5 per house for 28 houses to be erected at the expense of the local rates.

COLWYN BAY.—It has been resolved to erect a new central school on the Pendorlan site. A special committee is inquiring for a suitable site for a new school at Old Colwyn. The M.T. will contribute £18,750 towards the cost of widening the main road in the direction of Mochdre. Plans were approved for the erection in various parts of the urban district of 52 houses to be privately built.—The U.D.C. received a report by the engineer, Mr. W. J. Dunning, as to the lay-out of the Tan-lane Estate for the erection thereon of houses for the working classes. He proposes to construct a road through the land from near the Old Colwyn Station up to the main road to Abergele, with a fairly easy gradient, and from this the subsidiary roads would radiate. He had arranged that every house would have a view of the sea and also the necessary amount of sunlight. The plan showed 70 semi-detached houses, also blocks of four houses and six houses. Each house will have fittings for electric lighting and a bath. It was decided to arrange for the erection of 175 dwellings, and to provide for hot and cold water in all the semi-detached houses, but for cold water only in the four-house and six-house blocks.

CROYDON.—As a provisional contract is about to be entered into for the purchase of a site in London-road for the erection of public baths, the T.C. is applying for sanction to a loan of £3,350 for the purpose.—The T.C. has under consideration the acquisition of a site in the neighbourhood of Gloucester-road for the erection of slipper baths and public conveniences.—Plans have been approved for a public convenience at Parchmore Green, estimated to cost £1,500.—The B.S. has prepared plans for a public convenience in Portland-road, South Norwood.—At Thornton Heath Recreation Ground a children's playground, three hard tennis courts, bowling green, &c., are to be provided at a cost of about £3,000.—A site in Thornton-road is to be used as a children's playground pending the erection thereon of an elementary school.

DARLINGTON.—Plans approved: H. Parvin, eight houses, Haughton-road, Kellett, and Clayton; five houses, Belgrave-street, and new shop front, 40–42, Yarm-road.

DONCASTER.—Great changes, involving the transformation of an agricultural district into a busy industrial centre, are likely to follow the discovery of the famous Barnsley coal seam at a new pit at Thorne Moorends, near Doncaster. As long ago as 1909 sinking operations were commenced at this spot, and now, after stoppages due to the war and other causes, coal has been reached at a depth of 921½ yds., which means that the pit is the deepest in Yorkshire. It will, of course, be some time before the coal can be worked, but, according to the *Yorkshire Post*, plans are already laid out for a model village to accommodate at least 10,000 people, with sanitary schemes estimated to cost £60,000, and an elementary school to cost the County Council £20,000.

EASINGTON.—The R.D.C. has approved plans submitted by the Weardale Coal and Iron Co., for the erection of 75 houses at Wheatley Hill, and for 60 houses at Deaf Hill, for the Trimdon Coal Co.

EASTBOURNE.—Professor Adshead has prepared for the T.C. a report on the proposed improvement of the Grand-parade.

EGHAM.—The U.D.C. has prepared a scheme for a widening of the Great Western main road near Denham House, estimated to cost £4,500, and for footpath improvements in High-street to cost about £700.

ELLESMERE PORT.—The U.D.C. has passed plans for a building at the gasworks, estimated to cost £285. Loan sanctions have been received for £86,250 for the erection of houses, £9,110 for the construction of streets, and £1,290 for the construction of sewers. Plans have been passed for a house and laboratory for Messrs. Shell-Mex, Ltd., on their Stanlow estate.

FAILSWORTH.—A sub-committee is to be appointed to consider the question of public baths and washhouses, and the erection of a refuse destructor works.

FALKIRK.—The Dean of Guild Court has granted the Falkirk Iron Company, Ltd., warrant to erect, at an estimated cost of £3,000, a new grinding mill at the west side of Falkirk Foundry.

FAVERSHAM.—Plans passed by R.D.C.: New wing to Lorender House, for Mr. Lewis H. Finn; house at West End, Doddington, for Mr. F. Parsons.

FINCHLEY.—The M.H. has sanctioned a loan of £4,100 for sewer reconstruction in Totteridge-lane.—Extensions of the electricity undertaking are to be carried out at a cost of £17,750. A scheme is to be prepared for the widening of the Church End railway bridge.—A scheme for a central depot, to cost £10,000, is recommended, subject to a grant from the Unemployment Grants Committee.

GLAMORGAN.—The Ministry of Transport has intimated grant of 75 per cent. of the cost (£400,000) of the road which the Glamorgan C.C. is to construct from east to west to cut the entrances of the mining valleys. The C.C. is to put the work in hand before the winter sets in.

GLASGOW.—Among the linings granted at the Dean of Guild Court were: Corporation of Glasgow, for the erection of public baths and washhouses in Dobbie's Loan at Wood-street, estimated cost, £21,627; to Corporation of Glasgow, for erection of shops and dwelling-houses, at 3, Ell-road, Crosslee-street, Paisley-road, and Barlogan-avenue, estimated cost, £47,302; Governors of Victoria Infirmary, for erection of wood pavilion, operating theatres, &c., at hospital, Langside-road, estimated cost, £49,601; James Templeton & Co., carpet manufacturers, Greenhead, for erection of welfare block at factory there, estimated cost, £14,595; James Bennie & Sons, Ltd., engineers, Govan, for reconstruction of engineering works at Drumoyne-road.

GRAVESEND.—A Port of London Authority report states that progress has been made with the drainage scheme for the northern portion of the borough of Gravesend. All sewers are laid and the effluent outfall is under consideration.

HALE.—The Urban District Councils of Hale and Altrincham are joining in a scheme for widening the Hale railway bridge, at a cost of £6,000.

HALIFAX.—Another Halifax estate, that of Norton Tower, situate at Roils Head, is to be developed for building. Mr. Joseph Thompson, the owner, announces his intention of having between 30 and 40 houses, detached and semi-detached, erected, as purchasers desire. There are some 10 acres available, and there is ample room for tennis courts, while the extensive stables belonging to the mansion can be converted into garages for the residents of the proposed houses.

HARDINGSTONE (NORTHANTS).—The R.D.C. has adopted a £1,800 scheme for widening and resurfacing the Wootton-Quinton road.

HASLINGDEN.—The T.C. is to urge the L.M.S. Railway to provide improved accommodation at the railway station. The construction of a new road from Prinny Hill to Carrs is under consideration. It has been decided to remove the church of St. Stephen, Haslingden Grane, from its present position on the moorland road, to a site about a mile nearer Haslingden, and the contract for the work has been let. The cost will be £6,000.

HESSLE.—Plans passed by U.D.C.: House and garage, Davenport-avenue, for Mr. F. Fagil, by Messrs. North & Andrew, Whitefriargate, Hull, Sunday School at the north-west corner of the Congregational Church,

South-lane; by Mr. N. C. Windross, Anlaby Park, block of houses, Plantation-drive, Anlaby Park, for Mr. A. N. Winsop, Hull.

HULL.—Mr. John Bouch Willows has left £10,000 to the directors of the British Oil and Cake Mills, Ltd., Hull, for providing artisans' and labourers' cottages, on the conddition that during the life of his wife they, shall pay 5 per cent. on that sum to her. —The M.H. has sanctioned a loan of £1,400 for the erection of a public lavatory at the entrance to East Park.—The M.T. has promised a grant of £3,865 towards the cost of widening Anlaby-road, between Newinton level crossing and Calvert-lane.—The Housing Committee is negotiating with the M.H. regarding the rehousing of those who will be displaced by the New George-street improvement scheme.—Subsidy house plans passed: Ten houses, Southcoates-lane, for Mr. C. Smith; 12 houses, Beverley Estate, for Mr. T. Barnett; six houses, Monmouth-street, for Mr. J. S. Williamson. Sanction is being sought to a loan of £40,000 for further subsidy houses.—The B.S. has prepared plans for the following schemes: Hessle by-pass road, £84,000; Anlaby by-pass road, £14,390; road through West Bulls Farm, £50,000; extension of Preston-road, £22,500.

KETTERING.—The U.D.C. have approved a scheme for constructing an arterial road from the Northampton road to the Rockingham-road, at an estimated cost of £20,000.

LEAMINGTON.—Plans passed by T.C.: House, new road off Guy's Cliffe-avenue (Grand-avenue), for Messrs. S. A. Mason & Co.; sub-station, Tavistock-street, for the Midland Electric Light & Power Co.; additions, 39, Archery-road, for Mr. J. W. Jubb.

LEEDS.—The M.H. has sanctioned a loan of £6,500 for the erection of an elementary school at Meanwood. —The Town Clerk has been authorised to proceed with the preparation of a draft Bill to be promoted in Parliament containing provisions enabling the Corporation to carry out street improvements (including the widening to 80 ft. of the streets between Victoria-square and Vicar-lane), and the making of a new road from Vicar-lane to St. Peter's-street, and an improvement of York-road (involving the reconstruction of the tramway on a reserved sleeper track), and to authorise the borrowing of further money for the construction of water-works.- The following unemployment relief schemes have been prepared: Construction of a new road from the Gledhow Valley to Harrogate-road; construction of a new road along the line of the footpath in South Accommodation-road to Knowsthorpe-lane; the widening of Mabgate near St. Mary's Church; reconstruction of 40 roads.—Application is being made for sanction to a loan of £2,500 for additional accommodation at the Sanatorium.—The Tramways Committee has accepted a design for covering the barriers in Briggate, and authorised the work at a cost of about £1,800.—An outlet sewer in Spen-lane is to be constructed, at a cost of £860.—A tower is to be built on the Middleton housing estate to supply water to the higher portions of the estate.—Subsidies have been promised in respect of the following: Two houses, Vancouver-place, for Messrs. Carby, Hall & Sons; six houses, Old-lane, Beeston, for Messrs. Roddy & Sons; two houses, George-avenue, for Messrs. Reddyhough & Son; bungalow, Blue Hill-lane, for Mr. T. Givens; two houses, Calgary-place, for Messrs. Harrison & Co.; bungalow, George-avenue, for Mr. A. Horne.—The Town-Planning Committee is to consider a suggestion by the Civic Society for the provision of walking ways in Beeston and Middleton.—The Library Committee is to suggest to the Carnegie Trust a site in Compton-road for a branch library.

LENNOXTOWN.—Stirlingshire Education Authority has ordered the preparation of plans for the addition of four class-rooms to the Catholic school.

LINTHWAITE.—Plans passed by U.D.C: Two houses, Western-road, for Messrs. Orton & Avison.

LLANDUDNO.—The U.D.C. is applying for sanction for a loan of £8,300 for the erection of houses in Howard-road and St. Serriol's-road.—Plans passed: Eight houses, Gogarth-road, for Mr. F. Collis; three houses, Herkomer-road, for Messrs. Even Hughes & Co.

Obituary.

as occurred, at Daventry, of Mr. s, aged 75, who founded the firm ms & Son, builders, 45 years ago.

ok place recently, at his residence ue, West Hartlepool, of Mr. Robt. who, prior to his retirement 18 d been in business as a builder and many years.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Ayr.—ABATTOIR.—The Dean of Guild Court has passed plans for the reconstruction of the abattoir in Mill-street, for the Corporation, at an estimated cost of £14,800

Govanhill.—HOUSES.—The Glasgow Corporation has been requested to sanction the purchase of 49½ acres of ground at Govanhill, at a cost of £55,000, as a site for a further housing scheme.

Glasgow.—GENERAL.—The Dean of Guild Court has passed the following plans: The Glasgow Royal Cancer Hospital, Hill-street, Garnethill, addition to X-ray rooms; the National Bank of Scotland, alterations at 78, Union-street; Allen-Liversidge, Ltd., London, new works at Helen-street, Govan; the Corporation Tramways Dept., a covered stand at sports ground, Helenvale-street, Parkhead; Arthur Porter, 70, Cambridge-street, alterations at 42, Kelvinside-gardens; Cooper & Co.'s Stores, Ltd., 24, Howard-street, additions to premises in Howard-street and additions to premises at Howard-court; and alterations and additions to 28, Elmbank-street, for the Highlanders' Institute.

Stirling.—SCHOOL.—The Stirlingshire Education Authority intends to proceed with the erection of a new school at Riverside, Stirling.

Edinburgh.—GENERAL.—The Dean of Guild Court has passed the following plans: The Convent of the Sacred Heart, extension to the Convent at Craiglockhart; Thomas Cleave, bungalow at Dovecot-road, Corstorphine; Sir Robert Greig, house, at Barnton-avenue; Holiday Real Estate Co., four semi-detached houses, at Laverockbank-avenue; St. Bernard's Football Club, foundations and steelwork of grand stand, Gymnasium Grounds; and J. & A. M. Twaddle, bungalow at Craig's-road, Corstorphine.

Giffnock.—GENERAL.—The Buildings Committee of the Upper Renfrewshire District Committee has passed the following plans: Bungalow, Carolside-avenue, Clarkston, for John McCallum; villa at Elphinstone-road, Whitecraigs, for Robert H. Lindsay, 1,330, Pollok shaws-road, Glasgow; villa at Glenpatrick-road, Elderslie, for R. Snodgrass; bungalow at Douglas-avenue, Giffnock, for John K. M'Millan, 90, Main-street, Newton Mearns; four bungalows at Hamilton-drive, Giffnock, for John Taylor, 23, Eastwood-avenue, Giffnock; bungalow at Southview-avenue, Potterhill, for W. S. Reid, Linndale; a church hall and retiring rooms, at United Free Church, for the Building Committee of Mearns U.F. Church; villa at Woodland-avenue, Potterhill, for J. S. Hamilton, Corsehill, Potterhill-avenue, Paisley; shop and five houses at Paisley-road, Cardonald, for Paisley Provident Co-operative Society Ltd.; and additions to Kirkton Bleachworks, at Neilston, for James M'Haffie & Sons, Ltd.

CONTRACTS OPEN.

SEPTEMBER 2.—**Cupar.**—Extension of County Buildings and Sheriff Court offices, Cupar, for the Fife County Council. Particulars from Mr. C. R. Douglas, F.F.S., surveyor, Prudential Chambers, 15, East Port, Dunfermline. Deposit £2. Plans with J. M. Mitchell, Joint County Clerk, County Buildings, Cupar, or at office of architects, Messrs. Thoms & Wilkie, FF.R.I.B.A., 81, North-street, St. Andrews.

NO DATE.—**Dumbarton.**—Erection of four tenements of shops and houses at West Bridgend. Application for schedules, &c., should be made to Mr. W. A. Macartney, A.M.I.C.E., Burgh Engineer, Dumbarton.

The Glasgow School of Art.

The calendar of the Glasgow School of Art has just been issued for the Session 1924–5. Enrolment dates are from September 22–26. The School of Architecture is under the superintendence of a joint committee on Architecture, representative of the Royal Technical College, and the School of Art. Mr. T. H. Hughes, A.R.I.B.A., is Director of Studies, and Professor of Architectural Design, assisted by Professors A. M'Gibbon, A.R.I.B.A., and E. G. Wylie, A.R.I.B.A. Two studentships are awarded each year: the Arthur Leslie Hamilton Memorial Studentship and Medal and the Bourdon Memorial Studentship. The John Keppie Studentship is awarded in alternate years to students of Architecture and Sculpture. Several bursaries and prizes are also awarded. The secretary and treasurer of the school is Mr. John M. Groundwater, 167, Renfrew-street

Victoria Infirmary Extension.

An extension to Victoria Infirmary, Glasgow, was recently sanctioned. A new wing is to be erected at an approximate cost of £100,000. The extension consists of wards, with accessory buildings. An additional nurses' home will be built, containing 63 bedrooms, with sitting-rooms, bathrooms and lavatories, and a large recreation room. An extension to the dispensary is included. The buildings will be erected of stone, with fireproof floors and roofs. Additional escape stairs are arranged in suitable positions. The contractors are: Mason work, P. & W. Anderson; joiner work, John Cochrane; ferro-concrete work, Gray & Co.; plumber work, H. Twaddle & Son; plaster work, Wemyss & Livingstone; terrazzo work, G. Zani & Co. The work is under the supervision of Mr. H. E. Clifford, F.R.I.B.A., architect.

New Bridges for Glasgow.

A sub-committee of the Glasgow Corporation has recently recommended the construction of a bridge over the River Clyde in the centre of the city to relieve the traffic congestion. The proposal involves acquisitions of business property for street-widening purposes in Dixon-street and the removal of St. Enoch Parish Church and Subway Railway Station in St. Enoch-square. A new bridge is at present being constructed at Oswald-street, a few hundred yards down the river, but this is not considered sufficient for the purpose of relieving congestion.

ING TRADE WAGES IN SCOTLAND.*

g are the present rates of wages in the building trade in the principal towns of ry endeavour is made to ensure accuracy, but we cannot be responsible for errors r:—

TRADE NEWS

Messrs. Chas. Walker & Co. have removed from 174, Victoria-street, to 72–74, Victoria-street, S.W.1. The telephone number remains the same.

Messrs. The British Dolomont Co., Ltd., are removing to Astor House, Aldwych, directly opposite Australia House. Astor House is an eight-floor building, and the whole of the floors are being covered with Dolomont flooring.

Owing to a printers' error in our issue for August 15 the second line of Mr. H. Johnston Thomas's advertisement headed "Timber, Floorings, Matchings, etc.," read "2 in. by 4 in. good building timber, 10s. 6d. per 100 ft. run." The size should of course have been 2 in. by 3 in., as in our issue for August 1.

Messrs. Aspinall's Enamel, Ltd., of New Cross, London, S.E.15, have issued an attractive little booklet, entitled "Colour the Sunshine of Life," in which architects, builders and decorators will find much useful information concerning this firm's well-known brands of enamel, paint and distempers. "Sanalene" enamel, in four shades of white and 60 other colours and shades, is claimed to cover as much as 100 square yards per gallon, and "Wapicta" distemper 500 square yards per cwt.

We have received from Messrs. The Expanded Metal Co., Ltd., a booklet dealing with expanded metal at Wembley. At Wembley very large quantities of expanded metal lathing have been used for ceilings, internal and external walls, &c., while the heavier types of expanded metal have been used for innumerable purposes. The method of construction includes la external walling built of timber fra expanded metal lathing fixed to tim receive plaster. This, it is claimed and rapid form of construction, t required being low in cost, few readily obtainable, and quickly transported.

—No. 4257. SEPTEMBER 5 1924.

COAL AND POWER *

E have lived so long in an atmosphere of admiration for the efficiency of the nineteenth century that we are still capable of being shocked by the overthrow of some old illusion. We realise that chaotic inefficiency has been the leading ristic of town development and architecture. We his, and are trying with infinite toil to substitute sense and order. But before we can make bricks nsport materials we must obtain and utilise coal. ition in the mining industry—as observed by the man—is that it is a house divided against itself, may compare it with a volcano which, after a period, will burst into eruption for a few weeks lie quiescent until the pent-up gases are once more with devastating violence. Seeing that coal is not foundation of our own building industry but of the prosperity, these volcanic attributes are disquieting. ittle book we are shown a section of the volcano, and ining this we are lost in wonder, not that earthquakes otions occur periodically, but that the mountain lies for a moment.

ulliver had enlightened us on the mining methods in Laputa, we should have expected this story, because en Dean Swift was the most capable of illustrating cribing the futile and the preposterous. This comad, however, no need to resort to the imagination, re here given, in a matter of fact form, 139 pages each hich contains a fresh proof of our cupidity, stupidity, mpetence. The committee was well advised to make the outset that the report has no political significance ; st given facts, and then proposed remedies with which, , we may or may not agree. The report provides, an excellent opportunity for men of all opinions y it is that we are constantly on the edge of trouble nes, and why we are asked such preposterous prices reatest material assets—coal and power.

niner is dissatisfied because he receives inadequate ich are determined largely by what the poorest mines istrict can afford to pay, so that good mines can reap profits while low wages are being given. He feels miner has no voice in the conduct of the industry, t he can obtain by collective bargaining and by war. He resents the payment of royalties. The ical effect of these royalties is very great, because cannot see why a man should live in luxury, as he a distance on the sixpence a ton he levies on the those who spend their lives in digging coal in the the earth. The miner is further embittered by the l houses, and the ugly and filthy environment in and his family so frequently have to live.

nineowner also has his grievances, the first being rest itself; the second the multiplicity of mineral owners he has to deal with—there are no less than sand royalty owners: "The mineowner is at the the landowners whose land happens to contain A third difficulty is the obstinate and recalcitrant who will not co-operate with the others for efficient nd who insists upon extortionate demands, and means of overcoming factious or greedy opposition. ins of the shortness of working hours, but in this ably wrong, since men working freely and with a ce better results when excessive physical fatigue overning factor in output.

sumer, as we can all testify, is not without grievances. ged absurd prices, he feels that there are too many coal factors and merchants making a living out of the coal trade, and that they are making too much, and he believes that only waste and bad organisation or profiteering can explain the price he has to pay; "He feels that he is helpless in the hands of warring interests and warring political doctrines." The royalty owner alone seems to have no grievance.

But the worst feature of the whole business is the appalling waste of national resources. We need not here tabulate the objections to air pollution or to the waste of by-products involved in burning raw coal, but we would draw attention to the evidence given before the Coal Conservation Committee. Mr. Merz observed that 16,850,000 tons of coal were used in coal-burning furnaces in 1913, and he stated that one-fifth of this amount would have supplied the power required if the power were produced in large modern stations. Sir Richard Redmayne, in his Presidential Address to the Institute of Mining and Metallurgy, in 1915, stated that "the present power requirements of the country could be met by utilising one-third of the fuel consumed at present." While Great Britain, owing to its compactness, is pre-eminently suited for the distribution of power from great central power stations, yet we lag far behind America, Canada, and France, and plod along dependent in the main upon undertakings that are too small to be economical in working.

The conclusions arrived at by the committee are perfectly definite; nationalisation of mines is rejected on the ground that theory and practice combine to show that nationalisation in any form reduces efficiency and, therefore, either diminishes the amount available for wages or increases the price of the product. It is further insisted that if the miners want to manage the mines they ought to carry the full responsibility for raising the capital needed, and for making the industry pay. Nationalisation having been rejected, the report continues: "We believe that better results for all concerned will be attained by freeing the industry from the obstacles to efficiency which at present obstruct it, by continuing to enlist the energy, adaptability and resource of private enterprise in the business of mining coal, and by creating machinery whereby all parties engaged in the industry can frame and apply a common policy for its development, and whereby more human relations can be established between employer and employed." The report says that the duty of the State in a modern industrial society is not that it should undertake creative and productive functions, but that it should ensure the necessary conditions in which the creative enterprise and energy of its citizens can most effectively operate. The committee, while being strongly in favour of private enterprise, is no less insistent that private enterprise should be subject to strict control so that the old haphazard methods can be replaced by efficiency. This is the view we, in these columns, have consistently urged in favour of private enterprise in housing. Housing is a vital factor in the mining question, and we find, on page 45 of the report, that "It is a cardinal point of our proposals that the ugly and wasteful legacies of the past should be swept away and that not only better houses but better amenities . . . should be not the exception but the rule."

An appendix by Mr. R. A. Scott-James deals with housing conditions in mining areas. The author insists that "If there is any place in England which reveals in a striking and conspicuous way the finer possibilities of architecture it is surely the city of Durham . . . the early colliery owners, however, seem to have exceeded all other employers in their indifference to the conditions under which their workers lived."

The price of this book brings it within reach of everybody, and we hope it will be widely studied because, whether or not we agree with the proposed solutions, at least the facts are there, and these make it evident that drastic action is necessary.

Power. The Report of an Enquiry presided over by the Right Hon. ge, O.M., M.P. Price 1/- net. Hodder & Stoughton.

NOTES

Steel Frame and Reinforced Concrete Construction.

ARCHITECTS concerned with steel-frame and reinforced concrete construction will learn with pleasure of the forthcoming visit to the United States of Mr. Topham Forrest, Superintending Architect of the London County Council, to report to the London Building Acts Committee on modern methods of construction as practised in America. It has long been felt that the London Building Act and the L.C.C. Regulations for reinforced concrete construction are unduly irksome in regard to these methods of construction. We believe the Committee which for some two years has been considering these Regulations has now completed its work, and recommended considerable revisions to be made in order to bring the Regulations into line with up-to-date constructional methods.

Parliament and Housing.

WE will all agree with a statement by the Minister of Health in a contemporary that "Acts of Parliament cannot build houses"; on the contrary, the trend of recent legislation—the Finance Act of 1910, the Rent Restriction Acts, and the Housing Acts which have tended to encourage building by local authorities rather than by private enterprise—has been to check the building of houses by those who provided them before that legislation was enacted. But few will admit the correctness of the Minister's further statement that Acts of Parliament "provide means and remove obstacles" if he refers to building by house builders for private ownership. If the object of the new Act is to transfer housing to the local authorities and make us a nation of municipal tenants, we get a clearer idea of the Minister's meaning. Certainly the provision of "means" to the extent of over two thousand millions is on a gigantic scale, but it is probable that the only "obstacle" to be removed will be the builders and those who financed them to whom we looked for the houses in the past.

Housing Costs in Scotland.

AN intimation of the difficulties before the Government in carrying out its new housing programme is contained in a circular now being issued by the Scottish Board of Health. One of the differences in procedure between Mr. Wheatley's Act and the Act of 1923 is that whereas in the latter case the approval of tenders by the Board has not been necessary, under the new Act the price at which it is proposed to build houses for which a subsidy is asked will have to receive the approval of the Board. In pointing out that it expects the prices of new houses to approximate to those ruling early this year, the [illegible] states: "In the spring of this ye[ar] Board were approving tenders fo[r] of three apartments costing slightl[y] £300 for each flat even in countr[y] tricts. For the same type in [illegible] months the cost would appear in [illegible] cases to have increased by over [illegible] cent."

The Plasterer.

LONDON plasterers, di[s]fied with the settlem[ent] the recent dispute, demanding an increa[se] wages of 4d. per hour, and threate[n] further sectional strike. From *H[ousing] Betterment*, the journal of the Am[erican] National Housing Association, we [learn] that an American architect has inv[ented] a machine with which one plastere[r] six labourers can do the work of [twenty] plasterers. It is stated that in a [test] wall 222 ft. long by 9 ft. high, wit[h] quent gables, was plastered with [a] three-eighths of an inch thick by on[e] in two and a-half hours, and tha[t] machine has been taken up b[y] Japanese Government for use in rebu[ilding] operations. "The invention co[mes] states our contemporary, "followi[ng] exorbitant demands of the plas[terers] who are now earning twenty-five[shillings] a day and upwards with all kin[ds] bonuses." We are reminded o[f] dictum of Mr. Winston Churchill [at] Architectural Association recently,

Detail of the Doorway of the Baptistry, Florence: "The Creation of Adam and Eve."
BY LORENZO GHILBERTI.

l of Capital for Nebraska State pitol. MR. LEE LAWRIE, Sculptor.

a nation badly wants anything it ot allow the interests of a section to in its way, and we have in the e in the employment of masons, ed to in our last issue, as an example r own industry of the result of pting to force wages above the level the industry can afford to pay.

Sky-raper urch.

WE understand it is intended to erect (at a contemplated cost of £800,000) the Broadway Temple, New York, with its cruciform orium accommodating 2,000 people, in the form of a skyscraper building, surmounted by a tower terminating a revolving cross illuminated by city as a skysign advertisement. "church" will be set just above reet level. The special accompanyatures of the structure include an bly hall fit for concerts and dances; nasium for 800 persons; a swimpool with removable toilet cubicles th sexes; a stage and a cinema. nday school provision is mentioned, ower rooms and arrangements for c events are included. The upper of the establishment will be devoted ping apartments and kitchens, with g contrivances above the fifth level. This unusual scheme of so ehensive a character should furnish ie opportunity for a fresh form of ectural treatment. The cruciform laid out on a big scale and its parochial accommodation thus ed on a restricted site combine to the composition very distinctive, if rhaps entirely unprecedented in its . Double historic churches built bove the other are more or less r, as at Sainte Chapelle, Paris, the one in that case being connected as essory to a palace. St. Francesco, isi, is another splendid example. come to mind, as the twin groined and lower churches at Schwarzorf, with the square belfry rising at the crossing supporting its tall spire. Or, again, witness the double chapels of Eger Castle, Bohemia. Collegiate, ecclesiastical, or monastic establishments, with their adjacent buildings, mostly covered considerable sites, and included many purposes grouped round their church, which dominated the whole composition, as also happened, of course, in most of our large modern parochial centres.

Architectural Problems.

THIS American project, set on so limited a plot, obviously renders the skyscraper form inevitable in such a city. This must be so, whatever uses were applied to the subordinate parts of the scheme. Moreover, apart from these precise considerations in relation to the novelty of the particular programme thus briefly described, it may be incidentally remembered that in the Middle

Panel, St. George and Dragon, at Harkness Memorial Building.
MR. LEE LAWRIE, Sculptor.

Ages plays were periodically performed in churches and certain Psalms before then were accompanied by dancing. Usually, early basilican church plans provided cloistered baptisteries with a pool or spring set in the midst of a garth for the total immersion of the catechumens who congregated in the western narthex, which is still to be seen, marked off by a line crossing the nave next to where the font stands at Durham Cathedral. The swimming bath and gymnasium connected with the projected Broadway Temple at New York for promoting physical displays and aquatic events, arise, of course, from quite different ideals, and the absence of any school accommodation is equally distinctive. The architect cannot fail to recognise these conditions, and the lighting of such a building, and the provision of elevators to the several floor levels, as well as ample contrivance of emergency exits, must manifestly influence the architectural treatment irrespective of the ethical or religious aspects of the problem. Structurally, too, the weight of the swimming bath and its adjuncts naturally will determine the design, besides controlling the lay-out of the auditorium or cruciform "church" situated in the substructure just above the street level below which the basement will possibly be contrived after the manner of a crypt.

The Personal Craftsman.

IT was surprising in reading the recent discussion on the decline of the art of the silversmith to notice the absence of any mention of the individual craftsman of our own time, much of whose work suggests the very opposite of decline. The art must be looked for in the quarters where it may be found. The methods of industrialism do not admit the freedom to the worker out of which sensibility to beauty can find expression, and if we limit our view to this direction only we may easily admit what is accepted as the decline of the art. If, however, this failure must be recognised, it is none the less true that in other directions, in the hands of the craftsman working freely and directly, there is much vitality at the present day, and if we look in the right direction for it the art of the gold and silversmith shows great beauty and development.

Modelled Details for Carving. MR. LEE LAWRIE, Sculptor. (*See p.* 350.)

GENERAL NEWS

School of Building.

The enrolment dates of the London County Council School of Building, Ferndale-road, Brixton, for the session 1924–25, are from September 15–19.

British Non-Ferrous Research Association.

The British Non-Ferrous Research Association will hold a Conference on Bureaux of Information and "Special" Libraries from September 5–8, at Hertfordshire.

Bolingbroke Hospital Extension.

Sir James and Lady Carmichael, of Kingston Hill-place, Kingston, have given £10,000 towards the cost of erecting the William Shepherd Memorial Wing at the Bolinbroke Hospital, Wandsworth Common, S.W. The cost of this wing, it is estimated, will amount to £60,000.

Councillor's Building Contract.

A Councillor of Sheffield City Council wrote recently releasing the Corporation, if it wished, from his firm's contract to build 198 houses for over £88,000, in view of the recent decision concerning the position of company directors on public bodies. The Estates Committee accepted the offer, and adopted the tender of another firm for £88,744.

Operatives for Australia.

In the House of Commons recently attention was called to the fact that advertisements were appearing in the Press offering assisted passages to Australia to skilled carpenters, bricklayers, plasterers, masons, and plumbers for employment, chiefly in the State of Victoria.

In his reply, Mr. Lunn, the chairman of the Overseas Settlement Committee, states that the Government had not considered it desirable to interfere. He is now in a position to state that a telegram has been received from Melbourne requesting the Director of Emigration and Settlement, Australia House, to cancel all existing applications under the Victorian requisition, provided no hardship is involved. It is understood that the total number originally asked for was 800, and that 146 men, with their families, have actually sailed.

The Institute of Plumbers.

The Institute of Plumbers recently held their quarterly meeting at Cardiff, and were accorded a civic welcome by the Lord Mayor of Cardiff. Mr. J. W. Willoughby (Manchester) said there was a great affinity between the health of the people and the humble craft of the plumber. The plumber controlled the health of the towns, the sanitary arrangements, and the light, &c., and was therefore a factor to be considered.

Mr. George Wood, the President, in referring to the recent building trades dispute, expressed a hope that the peace they had now arrived at would be with them for a good time. There were undoubted lessons to be learned from the dispute, and he trusted that in future the plumbing trade would safeguard the interests for which they had been fighting. Throughout the dispute they, as master plumbers, had been loyal to the Master Builders' Federation, and had been congratulated on their solidarity.

A discussion on the proposed new constitution of the Institute, aiming at forming a federation of master plumbers, was adjourned to the November quarterly meeting of the Institute to be held at Sheffield.

Model for Humorous Gargoyle for Tower of Harkness Memorial Building.

MR. LEE LAWRIE, Sculptor.

Edgware Parade.

The address of Messrs. The Empire Stone Co., Ltd., is Thanet House, 231, Strand, London, W.C.2, and not as given in our issue of last week.

Clay Sketch for Relief for Nebraska State Capitol.

MR. LEE LAWRIE, Sculptor. (*See p.* 350.)

Architect's Estate.

Mr. William Winder Lee, of Victory Chamb Houndgate, Darlington, Durham, and Ardennes, Staindrop-road, Darlington, archi and surveyor, who died on April 2, left estat the gross value of £7,769 5s. 2d.; net persona £6,853 8s. 2d.

Building Materials Committee.

Major Harry Barnes has accepted an invi tion from the Minister of Health to become member of a committee to inquire and rep as to new materials or methods of construct which are now or may be available for the bui ing of houses for the working classes, and to ma recommendations as to the organisation requi for securing the adoption and use of appro new materials or methods by local authorit and other bodies or persons providing s houses.

COMPETITION NEW

Bridgeton Public Halls.

The assessor has made the following awards this competition:—(1) £150, Mr. C. Cow Voysey, 14, Gray's Inn-square, London; (2) £1 Messrs. D. McNaughton & Son, and John Arth 164, Bath-street, Glasgow; (3) £75, Mr. Wal Alison, 27, Kirk Wynd, Kirkcaldy; (4) £ Messrs. Harrison & Ash, 22, Ellison-place, Ne castle-upon-Tyne. The design placed first illustrated in this issue.

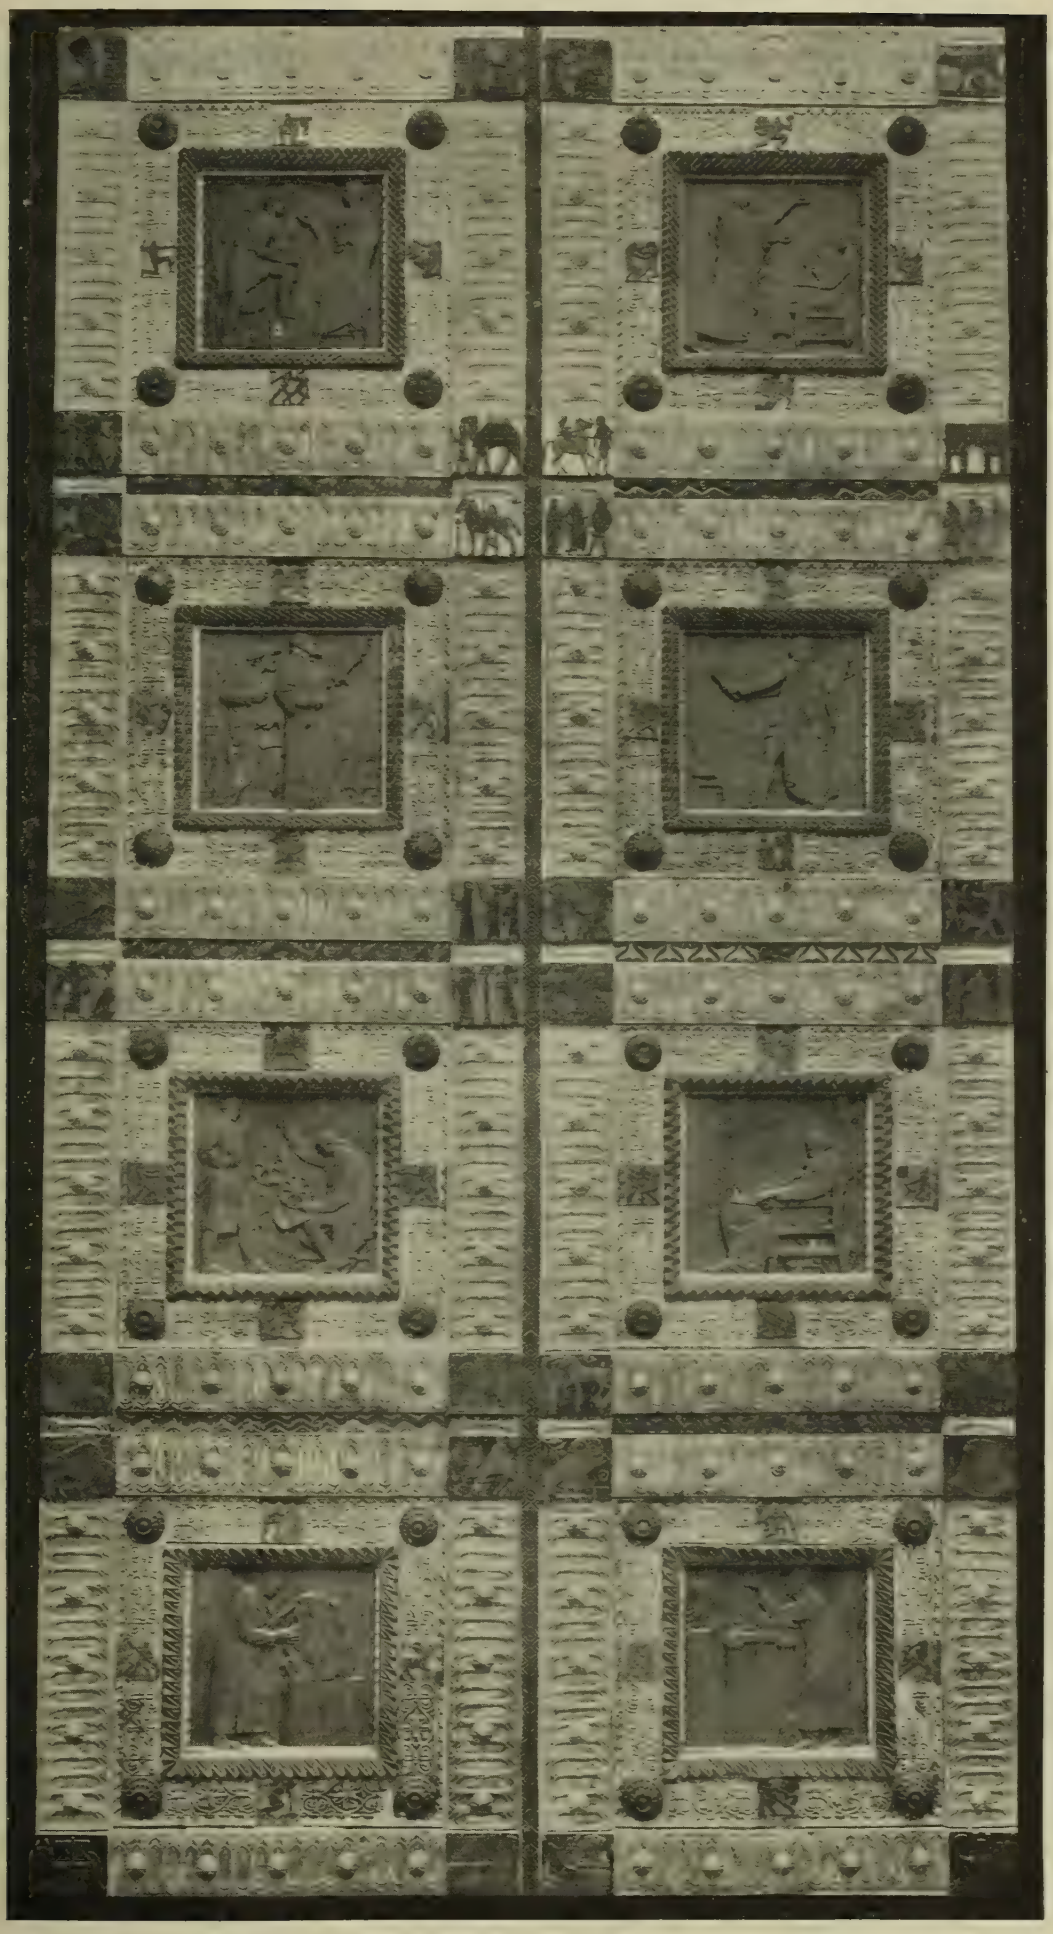
Methodist Church.

Designs are invited for a Methodist Chur school house and manse, Sheffield. Particula from Mr. T. A. Hardy, 24, Thornsett-roa Sheffield. (See advertisement this week.)

Masonic Memorial.

The sending-in day for this competition May 1, 1925.

Manchester Art Gallery.



The conditions of the competition for arc tectural designs for the new art gallery a museum of art to be built on the Piccadi site have now been issued by the Corporati and a copy may be seen at *The Build* office. The building is not to c more than £300,000 and is to be of Portla stone. It must be approached by a flight steps and must include a Hall of Memory commemorate Manchester men of all ra and services who fell in the war. The j of assessors consists of Mr. Paul Waterhou Professor C. H. Reilly, of Liverpool, and P. S. Worthington, who will award f prizes, the first of £500, the second of £3 the third of £200, and the fourth of £1 The building is to occupy an area not ceeding 5,500 sq. yds., and the total floor a required for the central sculptural hall 6,000 sq. ft. (See our issue for Aug. 22.)

Glasgow High School Memorial.

Competitive designs are invited for a memo club house and pavilion to be erected on ground of the Glasgow High School Club Anniesland, Glasgow. The competition is fined to former pupils of the High Schoo Glasgow. Premiums of £150, £100 and are offered respectively. Mr. John Kep F.R.I.B.A., Glasgow, has been appointed sessor. Sending-in day, Sept. 30. Particu and plans may be obtained from Mr. H. Buchanan, 172, St. Vincent-street, Glasg

Other Competitions.

Other competitions still open include following (the dates given are, first the se ing-in date, and second the issue of *The Bui* in which full particulars were given):—R Smith Memorial (Sept. 30; Feb. 22). Pu Baths, Newton-in-Makerfield (Sept. July 11). London Hotel, banned by R.I.I (Sept. 24; August 22).

Bronze Door, National Academy of Sciences, Washington. MR. LEE LAWRIE, Sculptor. (*See p.* 350.)

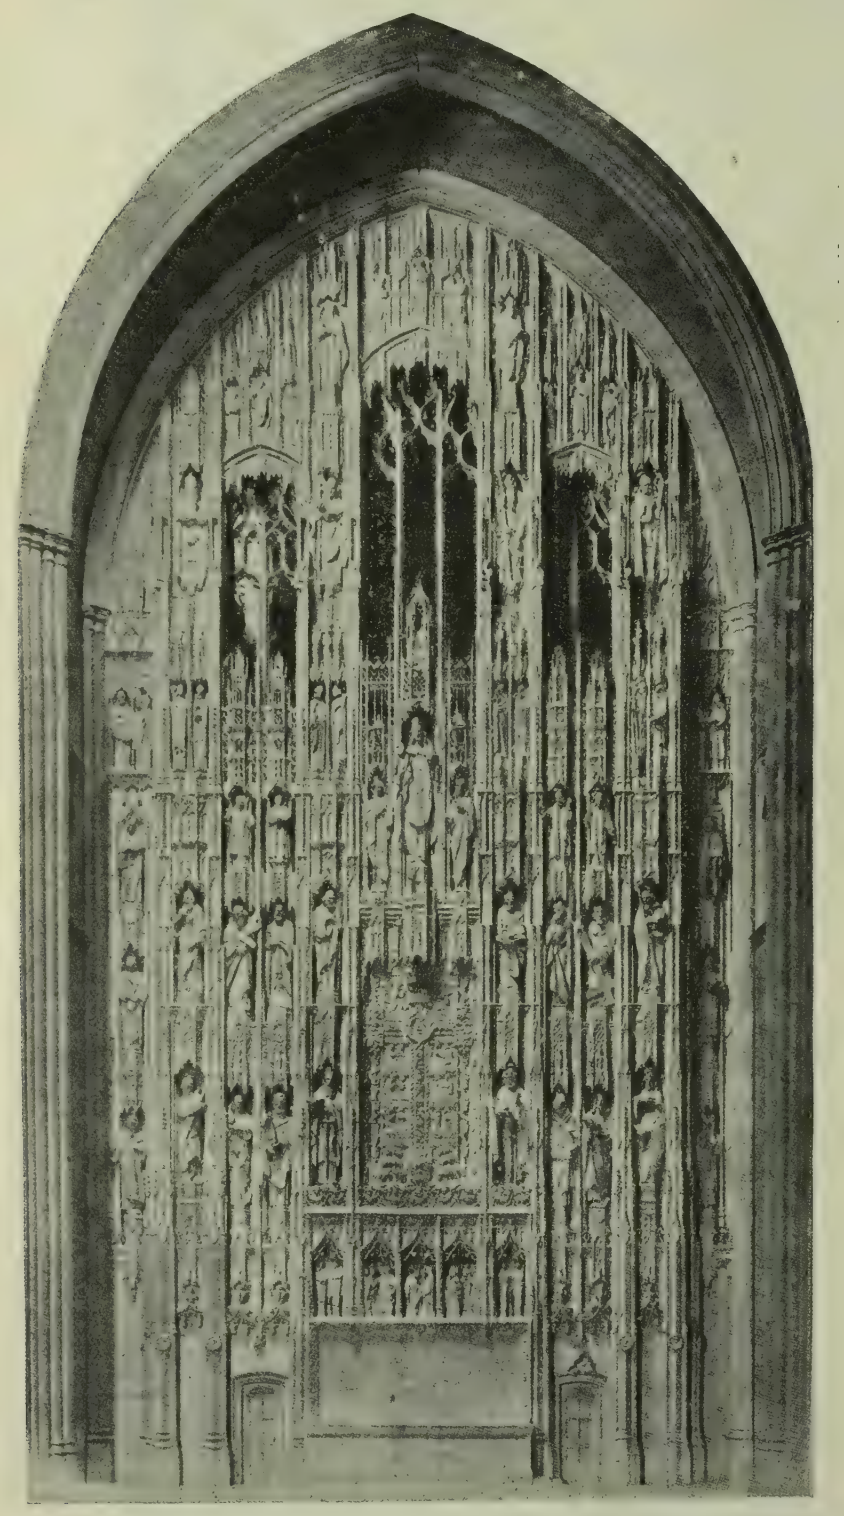
AN AMERICAN ARCHITECTURAL SCULPTOR: LEE LAWRIE

By KINETON PARKES.

New York is not only the habitat of the skyscraper unadorned, it is also the home of some of the most extensive and wholehearted expressions of neo-Gothic sculptural decoration and architecture.

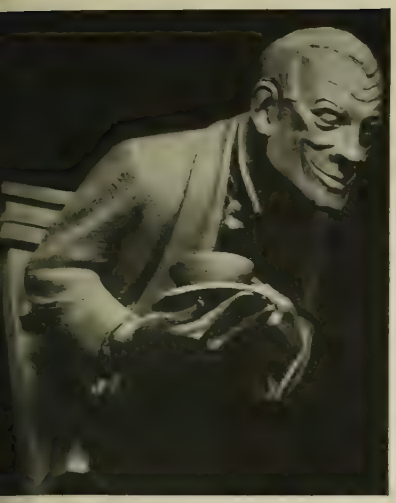
America is fortunate in synchronising the architect, Bertram Grosvenor Goodhue, and the sculptor, Lee Lawrie. The two men are friends and collaborators, and have worked together in a fashion that recalls Gilbert and Sullivan. As in the case of dramatist and musician the work of each is separate, so in that of architect and sculptor: their respective arts are dual, yet distinct.

One of the principal evidences of it is also one of the chief neo-Gothic works in New York, the Church of St. Thomas; but are other instances of the usefulness of "entente," the Nebraska State Capitol an Academy of Sciences at Washington. churches which owe their decorative val Lawrie are St. Vincent's, New York Mary's, at Tuxedo, and one at Pittsburg remarkable illustrations of the hold upo modern imagination of the Gothic idea, as as of the good fortune in having an exp of it of such sympathy and accomplishm



It is, however, of the architectural scul of Lee Lawrie and not of the actual arch ture of the buildings that I am concern the moment, and I have to note that La has also collaborated with James Ga Rogers, the architect of the Memorial Q rangle at Yale University, and has, more exercised his own palpable architectonic in many fine works which he has cr alone. He is a sculptural designer of the order; a master of plastic modelling student and lover of research, and a w of indomitable energy, persistency, fecundity.

Lee Lawrie was born in Germany in and went to the United States at an age. He received no academic art educa but worked in the studios of Saint Gau and Martiny from 1891 to 1905. He wa structor in sculpture for two years at Har and for ten at Yale, of which latter unive he is a graduate. The American Institu Architects awarded him a gold medal in He believes in the decoration of architec spaces in the way in which the Gothic a believed. He models for stone and wood. he essays polychromy. He rarely works the exhibition gallery, and so his sep pieces are few; in point of fact, he ha time for the formal finishing of such. decorating a building plastically there is need for the high finish of gallery req ments. His work is seen at its best carved and in situ, either as an integral of the structure or as applied decoration. aim is to prove that the dignity and stat the architectural sculptor are at least no than that of the statuaire.



The Church of St. Thomas, a stately includes numerous sculptural details—cor finials, crestings, and springs of arches- its chief plastic feature is the astonis reredos reaching from the chancel floor t apex of the roof. Broken by two doo the base, it rises in multiplying richnes two-thirds of its full height, until its mass is broken to admit the light of the windows behind. Its niches are surmo by serried pinnacles and crowded with no than eighty figures of varying sizes. the altar is a group of St. Thomas kne and other figures panelled to form a ground for the cross decorated with d and crown of thorns, and this serves as a for the main statuary of Christ, with St. and St. John on either side. Statu martyrs, saints, and ancient and m ecclesiastics abound, and the whole for strangely moving replica of the spirit animated the old cathedral builders, wi little of their eminently endearing sen form. The rich picture is framed i severely plain columns which soar in unb simplicity to the spring of the vaulting.

St. Vincent Ferrer is another New church which owes much to Lee Lawrie its main portal of a double doorway is carved and surmounted by a crucifixion of fine character. In this edifice is the esting cryselephantine Virgin and Ch coloured alabaster and onyx and silve gold, while in St. Mary's, Tuxedo, is a polychrome work, mostly of the materials, in the form of a triptych in of the Annunciation. A striking figure Michael forms a war memorial in a Pit church, and another important work stone pulpit bearing nine carved ecclesi figures.

Collegiate work is quite as sympath Lee Lawrie as ecclesiastical, and he fine opportunity in providing the archit

del for Humorous Gargoyle for wer of Harkness Memorial Building.
By Mr. Lee Lawrie.

lpture for James Gamble Rogers's Harkness morial group of buildings at Yale Univer-. Here again the sculptor had modern res to deal with in a Gothic setting, and success at St. Thomas's Church is sur-sed. The figures of the founder and alumni he University, and many others, are chiefly ised as details of the great memorial er, a tapering column with belfry, pin-les, buttresses, and niches, rivalling the Thomas's reredos in its decorative detail. figures of the modern subjects in the opied niches on the eight buttresses are ched by others higher up in the belfry nings of Phidias, Homer, Aristotle, and elid, standing for art and science, and on central buttresses others symbolising dicine, Law, Business, and the Church, in the angles of the cornerpieces, twelve resentative of the virtues and other sub-s. Further sculptural work is found on the rways, arches, and other parts of the build-s, and quadrangle architecture, here and re touched with humour as in the gargoyles heads of undergraduates. A particularly utiful piece of ornament is the panel of University Arms on the main archway, ther interesting detail being the St. George Dragon panel. It is in the decorative de-s of works of this kind that the talent of Lawrie presents itself so strikingly. He st have modelled hundreds and hundreds the many works he has been called on to dertake, and they are all marked by an un-ying sense of fitness of subject and situa-n, and all made without compunction or plaining; sincere art and honest crafts-ship.

Goodhue is again the architect who enters collaboration with Lee Lawrie in the ldings for the Nebraska State Capitol, at coln, Nebraska, now being built. Lawrie made for this big job his usual varied and nerous series of illuminating and suggestive igns. There is a sketch model of an en-nce with many steps, flanked by huge ble bull-reliefs, surmounting a tunnel, and ling by more steps to double doors set in n masonry, and headed by a vigorous relief bullocks and wagons, and enclosed by mas-pylons bearing ornamental reliefs, with haut-reliefs of full figures of men on er side a lunette. There is a series of ches with Assyrian motives, the lead to gh is given by a huge ornamental buffalo ted in Assyrian fashion and bearing well-red inscriptions. The motive is continued ugh several modelled friezes, depicting r offerings, slave offerings, victory offer-, and leading to more friezes in which iæval subjects of the Development of Law, Magna Charta (pierced for a balcony d), and those of the eighteenth century, such as the Signing of the Declaration of Independence, are used. The buttress figures are two of a series of Law-Makers, and, in addition, there are ornamental capitals in which Nebraskan motives are used to immense advantage as the indigenous fauna and flora of Australia was used and urged by Lucien Henry last century. The new and vigorous life such a method of treatment ensures is well illustrated in these strong fresh designs.

This series of works is matched by that for the National Academy of Sciences at Washington, again with the same architect. In this an even wider view of the past has been taken, and Egyptian and Greek motives added to Assyrian. Mediævalism is again exploited, and later periods of the seventeenth, eighteenth, and nineteenth centuries are modified by a certain amount of classicism, or at least formalism, to go seriatim with the rest. The great philosophers and scientists are represented in a magnificent set of at least half-a-dozen bas-reliefs, from Hippocrates and Aristotle to Darwin and Pasteur, each relief being enclosed in a repeating symbolical ornamental border. A corresponding border with carved bosses of human and animal figures encloses the eight panels of the fine bronze door of the Academy, each containing a square pictorial plaquette, the whole producing a very rich, even sumptuous effect. Other details include panels of the Zodiac signs, forming part of a bronze grille, terminals of pillars of naturalistic heads with ornamental accessories for lamp standards, crestings in bronze of botanical and zoological indigenous motives, which repeats for the full length of the building, and classical low reliefs of occupations for ceiling decoration.

Other important statues and ornament are to be found at the United States Military Academy at West Point, and there are hundreds of busts, statues, groups, reliefs, and other isolated examples of Lee Lawrie's exceptional capacity for turning out the best of work in the shortest possible time without scamping, in various cities and states of America. He is indefatigable in support of his aim of trying to bring a fresher impulse into architectural sculpture than that of the architectural modelling shops that copy the plates of the accepted styles, and of his endeavour to make the appellation of architectural sculptor as acceptable in art as that of the maker of statues or of ideal groups. It is a just and estimable ambition, and is admirably supported by the work with which he endeavours to justify it.

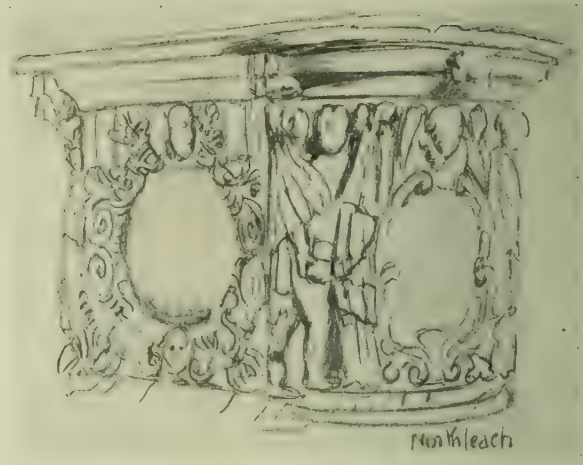
Sports Pavilion at Grove Park, Kent.

The perspective drawing illustrated in this week's issue is of a sports pavilion to be erected as a war memorial on the City of London School Sports Ground at Grove Park, Kent.



On the ground floor are provided two large changing rooms, an extra changing room, and a groundsman's room. Also a large room with shower baths and lavatory basins, with w.c.'s and urinals adjoining, and the boiler house.

On the first floor are a large tea room with service kitchen, and master's dressing room. Two partially-covered stands on the east and west side of the building give an excellent view of cricket, football, and other sports, and can be approached by way of the external steps or the tea room, which can be reached either from the stands or by a separate staircase communicating direct with the ground floor.

On the second floor are the caretaker's quarters, consisting of living room, two bedrooms, kitchen arrangement, w.c., and bathroom.

Caerwys Memorial Institute. MESSRS. REES & HOLT, Architects.

In Northleach Churchyard.

The building is of red brick with cement stucco dressings, tiled roof, surmounted by a copper-covered fleche containing a clock.

Messrs. Ralph Knott, F.R.I.B.A., and E. S. Collins are the architects.

Masonic Hall, Stroud.

This building was designed by Messrs. Falconer, Baker & Campbell, of 12, Buckingham-street, W.C.2, to provide accommodation for the Masonic confraternity of a country town. The site is a sloping one to the street, and the temple and dining-room were placed at the back, with hall, serveries, cloakrooms, &c., to the front. Since the design was prepared the Masonic Lodges in Stroud have secured an interest in the subscription room designed by Basevi, and this is to be re-arranged and enlarged to the designs of Messrs. Falconer, Baker & Campbell, which were selected in a limited architectural competition.

Loggia and Terrace, Coombe Ridge.

This loggia and terrace formed part of an extensive scheme of alterations at the house which were carried out by Messrs. Prestige & Co., of Grosvenor-road, S.W.1, a year or so ago. The terrace paving is in York self-faced stone, and the dressed stonework is in Doulting stone.

The architect is Mr. E. Guy Dawber, F.S.A., F.R.I.B.A.

Bridgeton Public Halls Competition.

We give this week the design, by Mr. Cowles-Voysey, A.R.I.B.A., placed first in Bridgeton Public Halls Competition. The result is given on p. 348.

St. Margaret's Church, Putney.

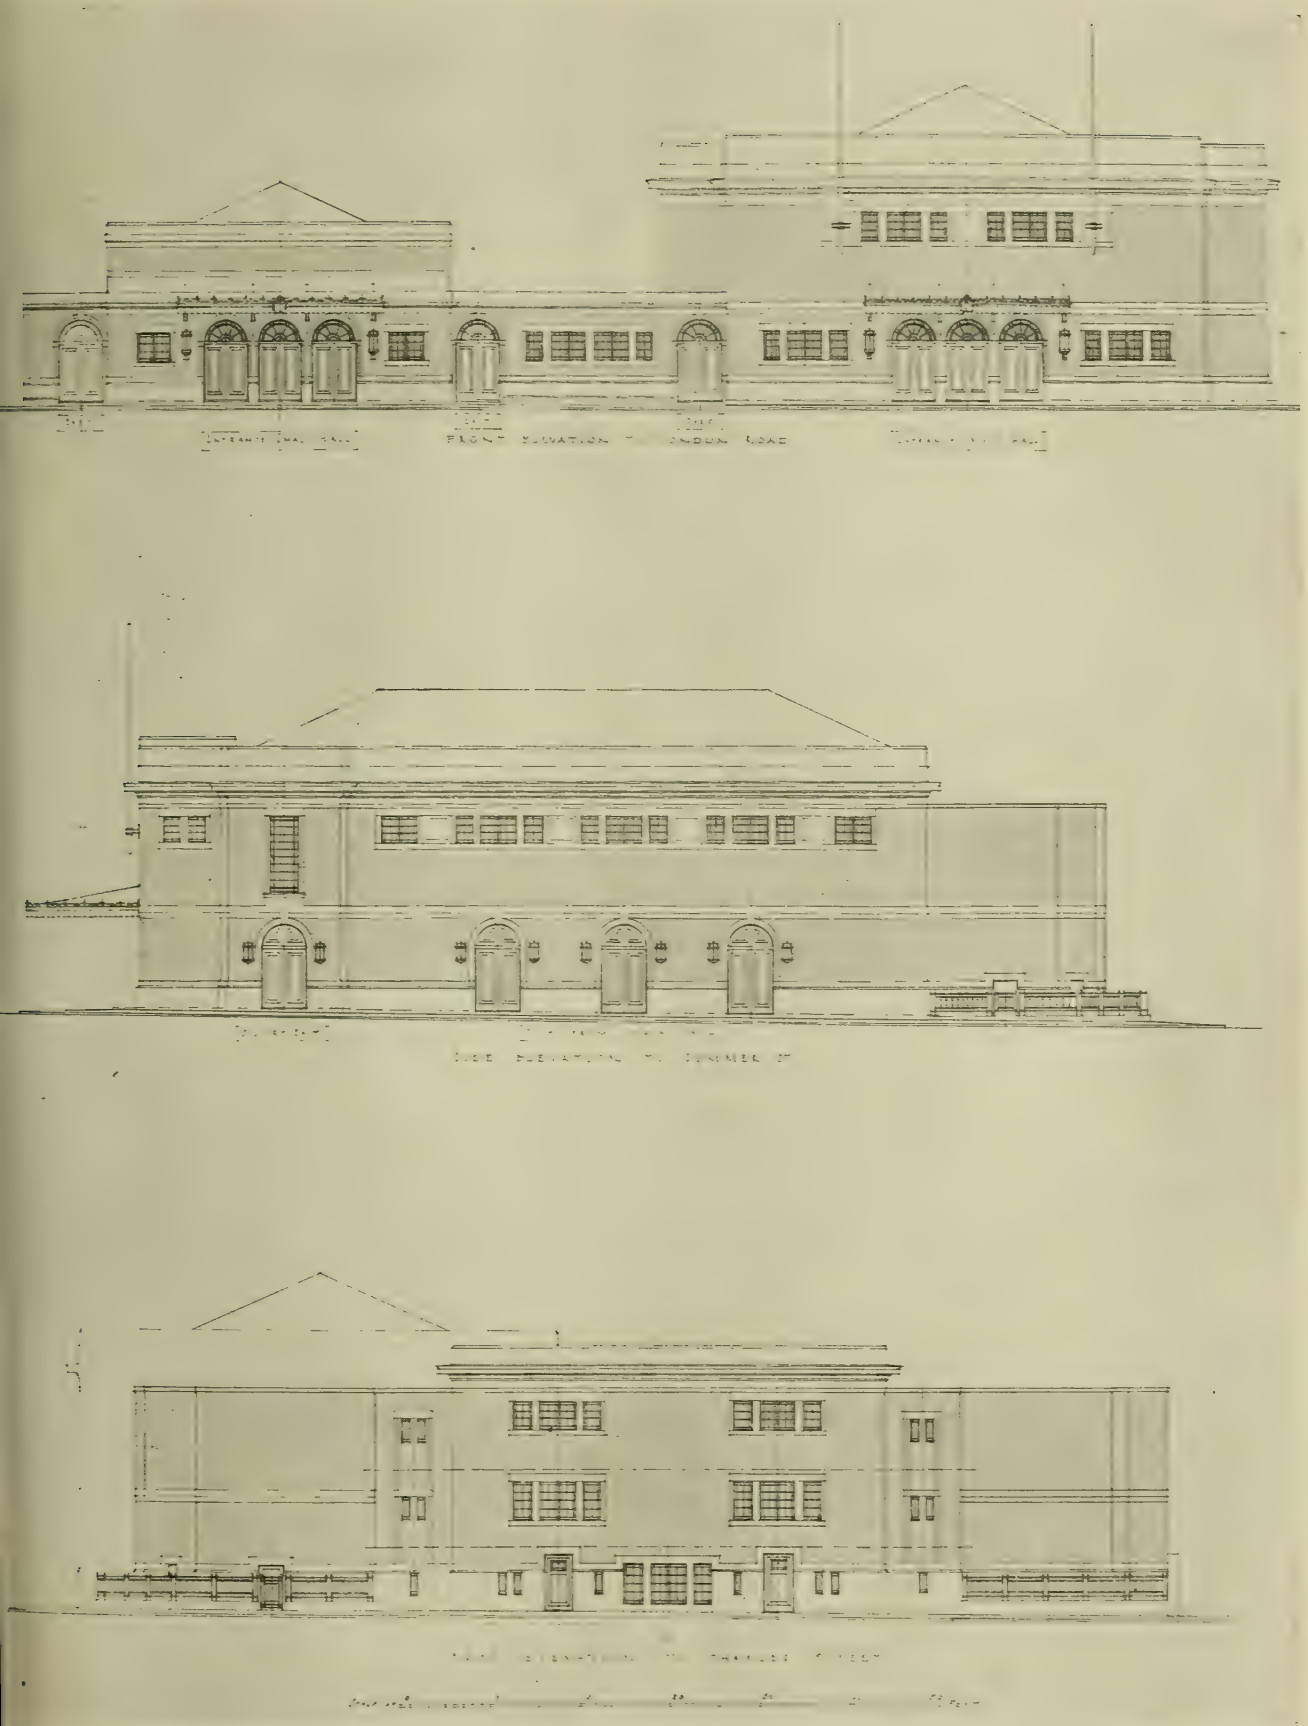
The church is to be enlarged by a considera extension eastwards, and this drawing (fr the R.A. Exhibition, in water-colour by architect, Mr. H. P. Burke Downing, F.S. of Westminster), shows the east end in design. It is marked by a severe simplic and economy, features no doubt in some meas dictated by conditions of the undertaking the nature of the existing building, but used aid rather than hinder the achievement o dignified character. The present building i Kentish rag stone.

Caerwys Memorial Hall, North Wales.

This hall was erected in memory of the fa in the war. It consists of library and reac room, billiard room for men, and reading sewing room for ladies, kitchen, service, On the land adjoining the hall are bow green and tennis courts. The building i brick, cement rough-cast whitened, ro slated roof, and rustic brick base.

The contractor was Mr. Robert Willi Brymbo, near Wrexham; and the archit Messrs. Rees & Holt, Liverpool. The buil was formally opened by the Rt. Hon. D Lloyd George.

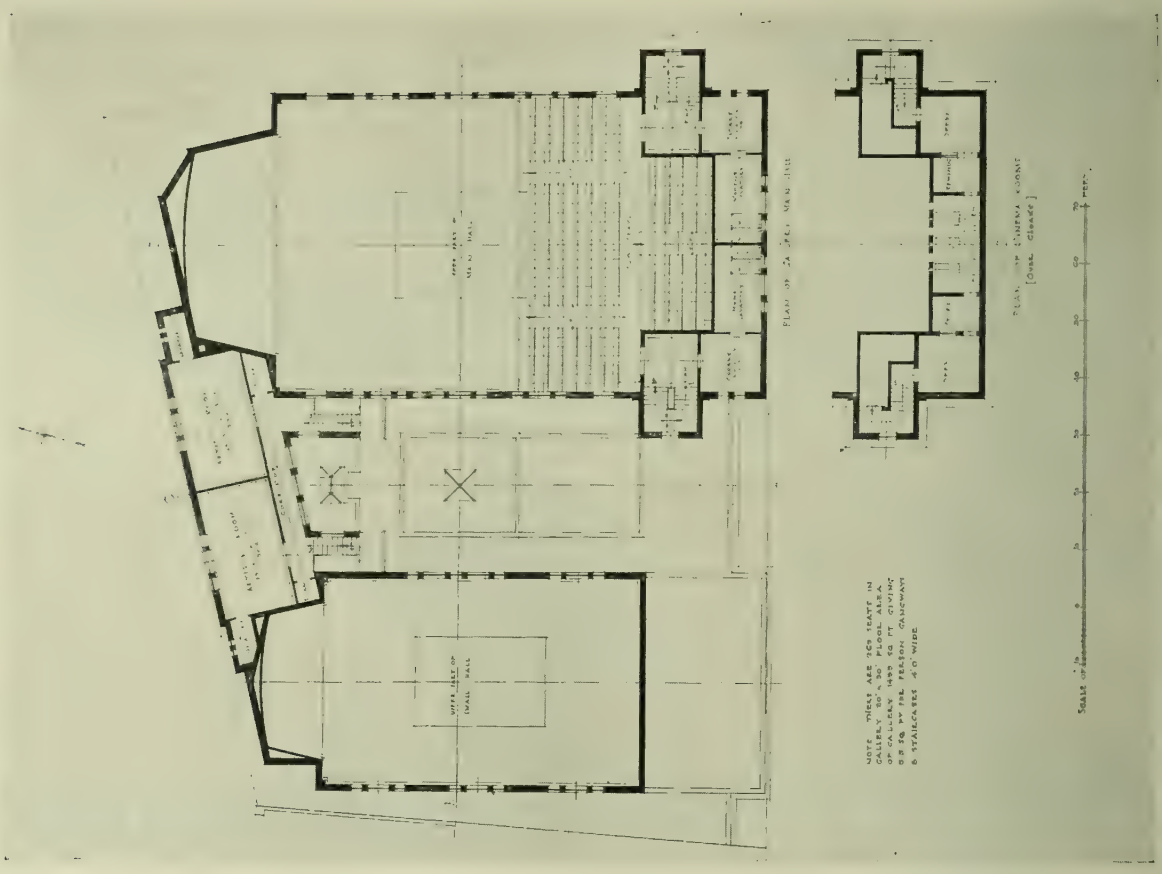
Royal Naval Barracks Church, Devonpo



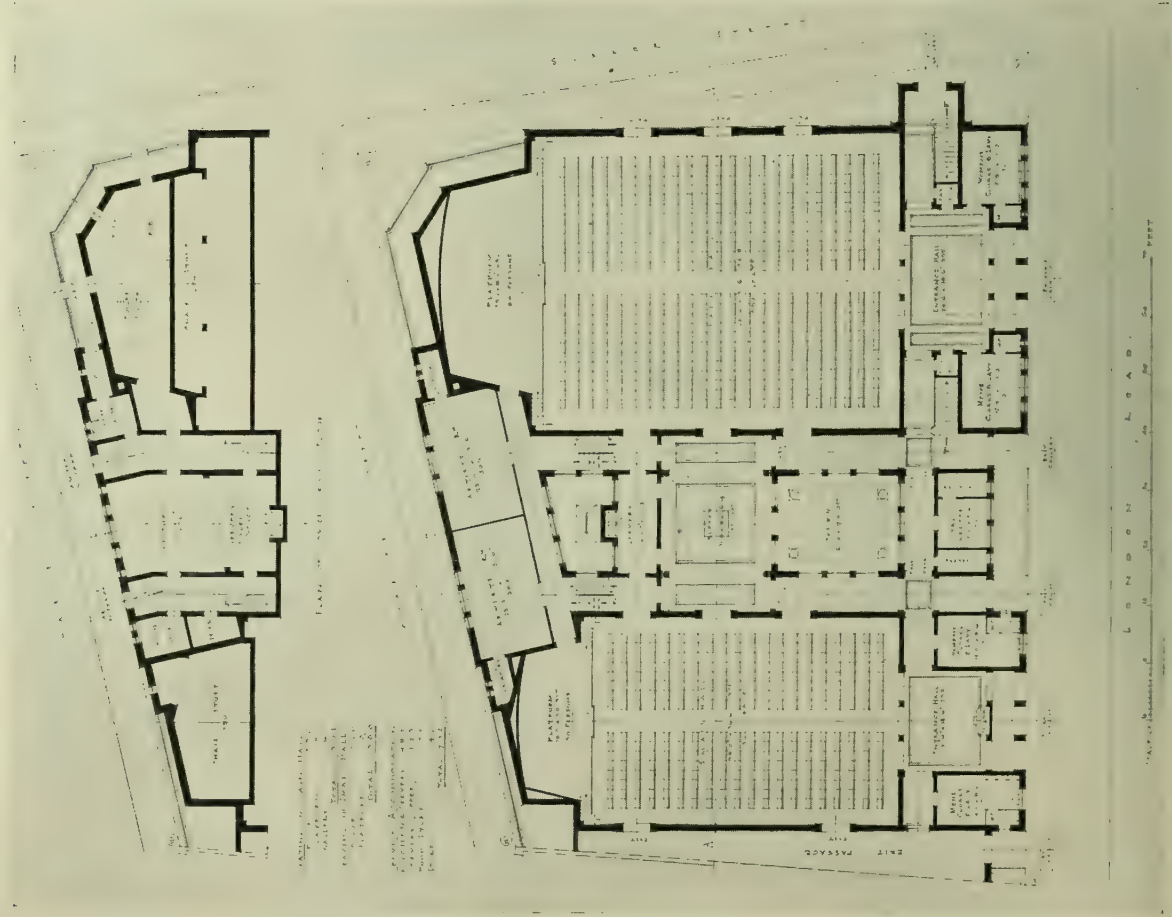
In the description in our last issue situation of this Church was wrongly give Southsea.

Gardener's Cottage at Lowfield Heath

The gardener's cottage at Hydecroft, Low Heath, Crawley, was erected by Messrs King & Sons, of Horley. The entrance piers and the plinth are in Horsham s also the chimney stack, and the rest of building is slurried brickwork with half ti framing of old oak. The roof was designe thatch, but was carried out in old tiles. H. Lidbetter, A.R.I.B.A., is the architect.



New Colliery Offices, Thorncliffe, Sheffie



The general contractor for this work wa J. T. Wailes, 23, Layerthorpe, Yorks. heating installation and steel roof was the of the engineering department of Messrs. Ne Chambers & Co.

use of metal for the treatment of buildings onstrated by Messrs. Fredk. Braby & Co. ns of their pavilion in the eastern section British Empire Exhibition. The building xample of the application of metal for branch of building work, and is entirely cted of metal, including walls, floors, nd finishings.

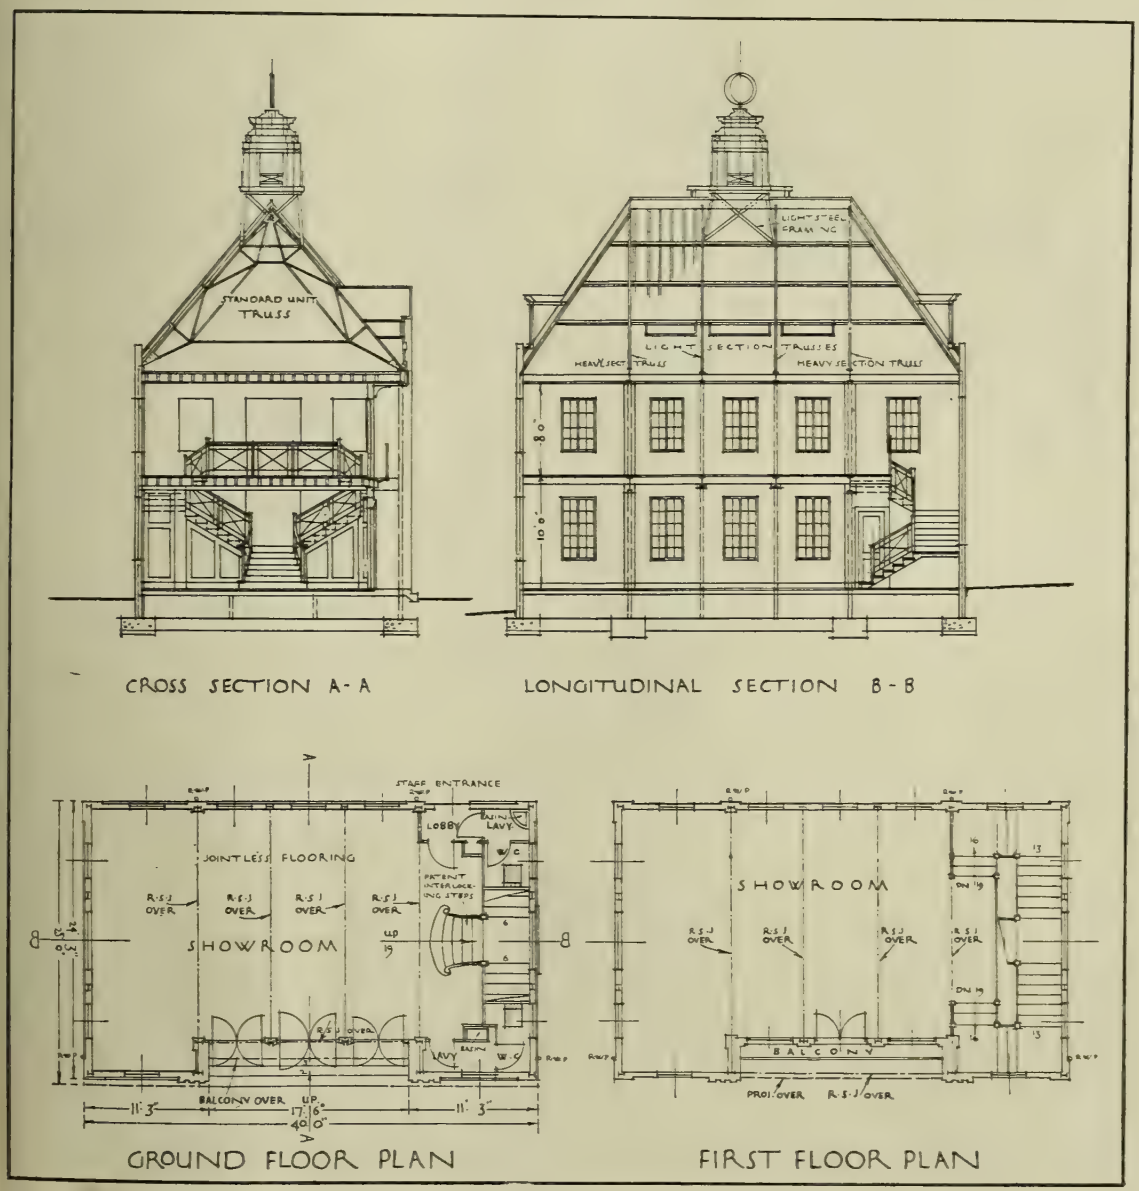
entrance front has a large central feature d by a rectangular architrave formed of d copper, and contains a recessed le two stories in height entirely executed ze, with bronze doors and screens. The bordinate wings to this central feature ated with copper window panels flanked ticated steel sheet panels. The design d somewhat upon the typical Indian y of the Mogul period. The roof s copper and zinc roofing tiles with a motif, and is surmounted by a copper- dome or fleche. Copper covering for s, parapets, string courses and mouldings osed positions are all illustrated in the building. Metal casements of many various types are shown, including those of large dimensions as well as the ordinary sizes. The back elevation is covered with stamped sheet steel of a new pattern. The lettering is encased with copper and sunk to receive on the face a coloured wax enamel.

The interior generally has been lined with stamped steel sheets and painted in a French grey picked out with a soft blue to form a suitable background for the various metal articles on exhibition. The inside of the building is decorated throughout with material manufactured by Necol Industrial Collodions, Ltd., and "Necol" materials are also employed to obtain the bronze effect on steel shown outside the building, the work being executed by Messrs. Green & Abbott, Ltd.,

The roof is constructed of unit steel trusses which have been exposed to view, and picked out in a metallic paint. The flooring is of steel girders and joists filled in with pressed steel ribs carrying composition flooring or concrete. The staircase is executed in a special type of pressed steel formed on the unit and interlocking principle.

The architect is Mr. W. Braxton Sinclair, F.R.I.B.A., of 8, Buckingham-street, Adelphi, W.C.2.

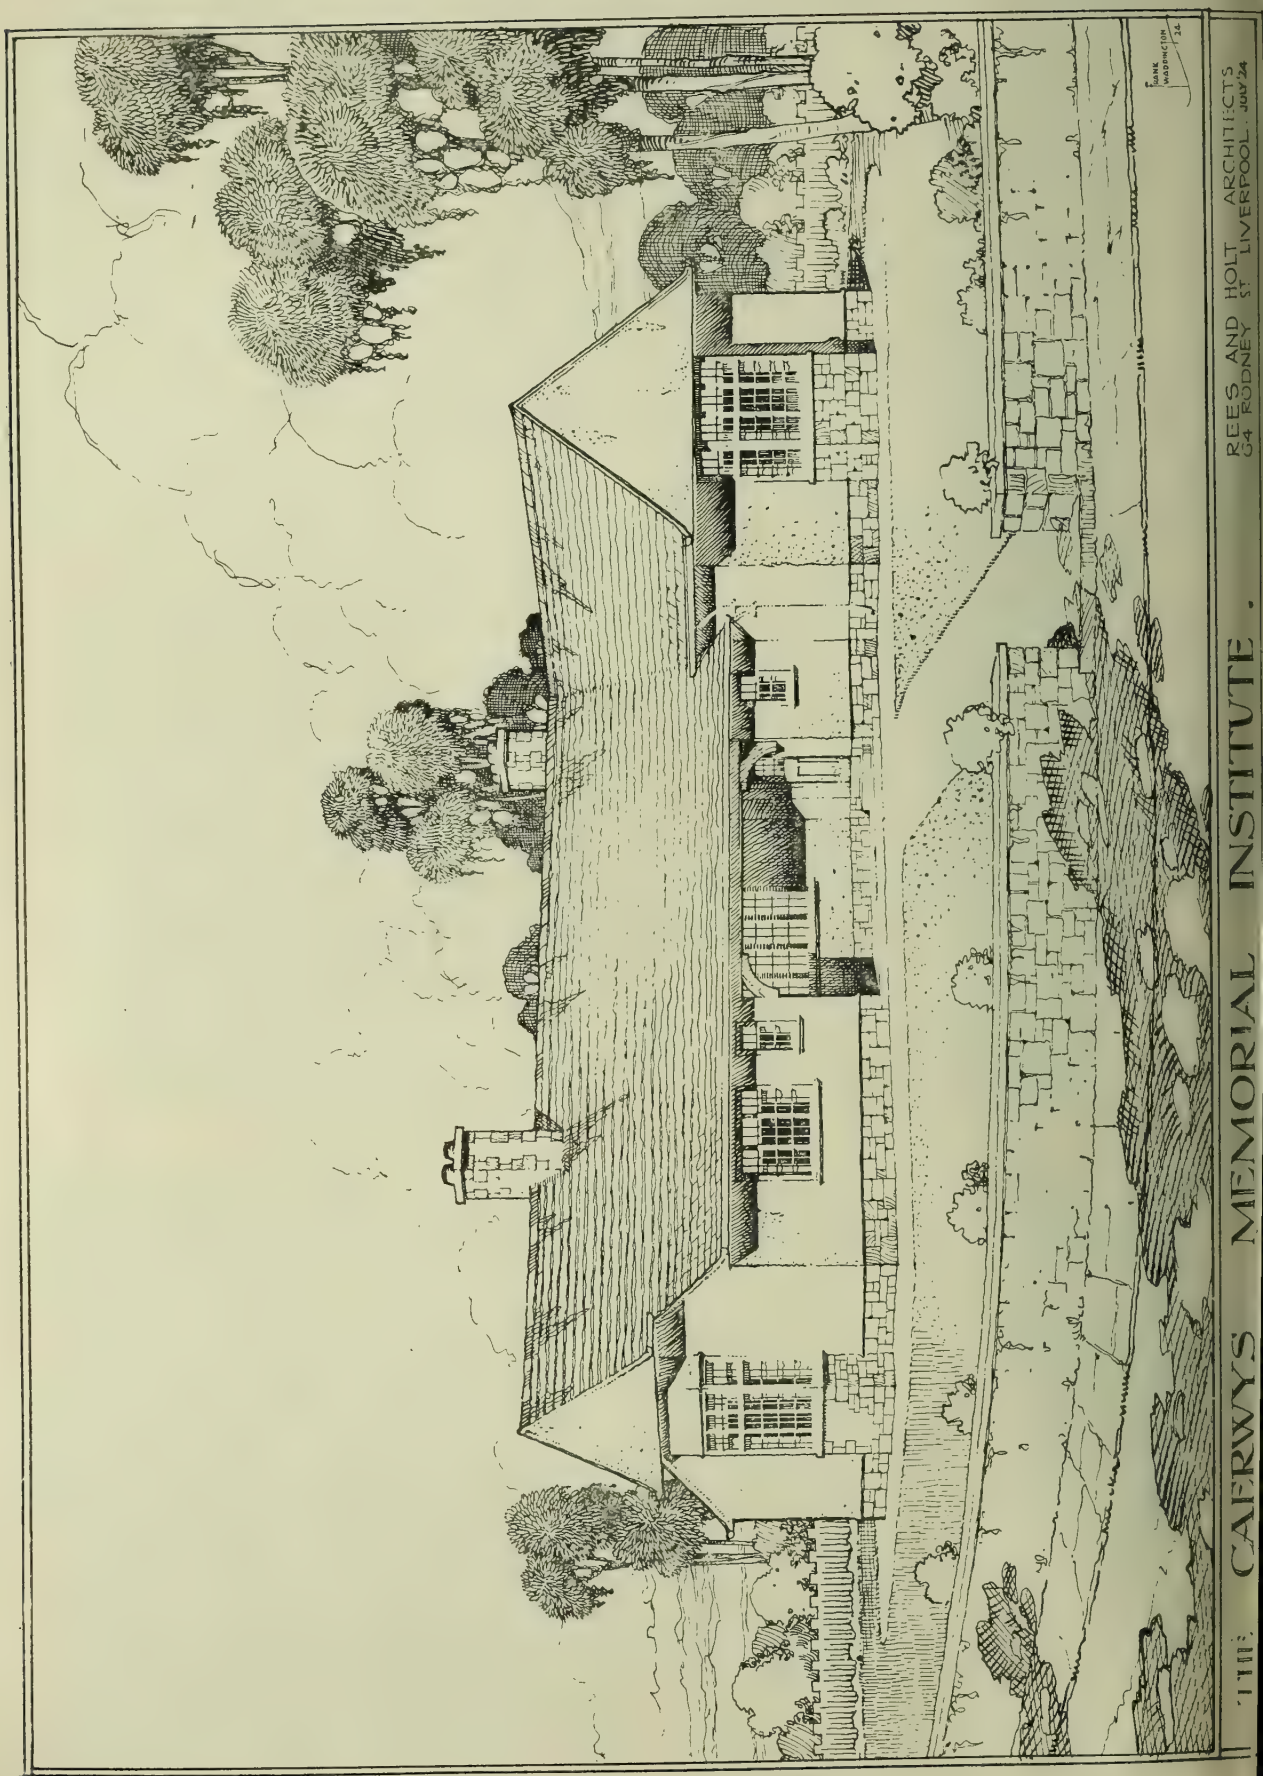
LAND FOR ROAD WIDENING



Mr. J. D. Wallis, Official Arbitrator under the Acquisition of Land (Assessment of Compensation), Act, 1919, sitting at Burton-on-Trent, heard a claim against the Burton Corporation by Mr. George W. Parsons, concerning the Corporation's acquisition of certain property for the widening of a road.

Mr. Whittaker, solicitor, of Messrs. J. K. Nye and Donne, Brighton, put in a claim of £2,250. The property had cost Mr. Parsons about £4,000.

Mr. Edward German, acting for the Corporation, valued the property at £1,266 8s.



The Arbitrator has since issued his award as follows: —

(1) The Acquiring Authority to pay to the owner the sum of £1,750 as purchase money and compensation; (2) the Acquiring Authority to pay interest at the rate of 5 per cent. per annum from the date of entry until payment of the compensation; (3) the Acquiring Authority to pay the fees on this award; (4) each party to pay their own costs.

ESTMINSTER ABBEY RE-EXAMINED—VII.

By W. R. LETHABY.

The Abbey Buildings.

xcellent foundation for a full study of bey buildings was laid by Mr. Micklein a paper printed in the *Archæological* 1875.

he east side of the Cloister extending rds from the Chapter House entry is range of buildings once occupied by the ory, with vaulted cellars beneath. On h side of the Cloister was the Refectory, ned. The Dorter range runs on beyond end of the Refectory for some distance. terminated by a transverse building, e Dorter. The west end of this, where apped the end of the passage extension he Cloister, was destroyed about a ion since, when the usual recessed tments of a Rere Dorter were found. uildings are of early Norman character. ndercroft of the Dorter, now the Abbey n, is divided into two spans by a row of ow cylindrical pillars from which spring supporting vaults of concreted rubble. ginal capitals had a single steep chamfer g the form of the shaft with a square bout twice as high above; the bases atter chamfer projecting further. Most capitals were altered in the century g the first building; some of them, he Pyx Chapel especially, have interestvings. In the east and west walls of f the bays were single windows about de on the inside. All the arches of the s and vaults were built of two varieties , a coarse tufa and chalk or Caen stone, rnately. At the north end—the Chapel Pyx—the "Norman" work has been into by the newer building. At the nd there is a "respond" in the centre to those on the side walls.

comparison with the crypt of Winchester al, begun in 1179, Mr. Bilson pointed t our work is a little less advanced. At ster the lower member of the capitals ly convex, the square planned abacus hollow chamfer, and there are impost gs to the wall piers. At Westminster nes of the vault are, as usual, set out semi-circle, in this case to the slightly r wall arches east and west of the Pyx the arches of wider span are segments es struck from centres a little below nging line, so that all the arches rise same level at their crowns. The same is followed at Winchester. The vaults idently built, as usual, on a through- barrel centering with sections of g applied on either side. The crowns aults are level.

se advances at Winchester justify our the Westminster undercroft a little n date. . . . We may conclude that astic buildings would be pushed forward Conquest and this eastern range would arliest work. If not a little earlier it the work of Abbot Vitalis, whom the or brought from Bernay about 1076, ny case to judge from Winchester it be later than his time." (*Archæo- ournal*, 1910.)

old Dormitory is now occupied by ster School. On both sides within traces of the original ancient windows, all of which were subdivided in the hich followed on the fire of 1298, and ese still serves its purpose. A doorway emains near the south-west angle of er has alternate voussoirs of tufa and ne showing dark and light, like the f the cellars below, and doubtless the vindows had similar arches. The head of the window next the southle is preserved in a class room; this apitals of the nook shafts still in place, nner arch rims have the two different stone. This great room, eleven or ays long, with a handsome window in each bay, must have been a fine and impressive thing.

On taking out a decayed and fractured capital from the outside of a hidden window on the east side of the Dormitory (October 23, 1910), we found that the back of it still retained its carved form which was entirely similar to those near the south-west angle just mentioned. This capital is preserved in the Museum, where there is also another which is as fair and fresh as the day when it was wrought. All were evidently of the same form. They were only set on the shafts, and not bonded into the jambs. (Fig. 1). They are of a type used

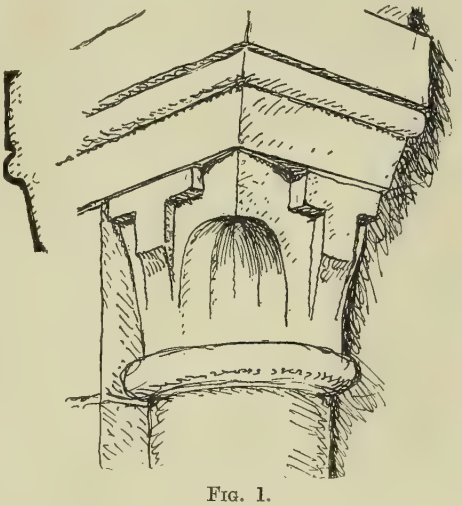

Fig. 1.

at Jumièges and at the Tower of London. We found that the window shafts were 6 in. in diameter in separate stones 4 ft. 8 in. long, which rested on bases having flat chamfers. The arch stones were of tufa and freestone (or chalk) (Fig. 2). A day or two later part of

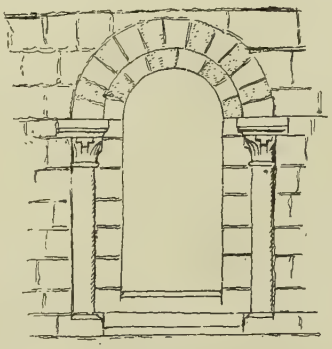

Fig. 2.

a second window arch was found on the same side at a distance of about 14½ ft. (or one bay) from centre to centre. There were three and a-half courses of masonry here above the window arch, and on the other side more remained. The windows of Westminster Hall were very similar, having recessed jambs and nook shafts. These facts give very complete knowledge of this range of buildings.

A view of the Rere-Dorter (under destruction) is given by Mr. Westlake, together with an enlarged detail of the arched recesses along the walls. Even these little arches were formed with dark and light stones alternately, as evidently were all the arches of the Dorter range. The walls within were plastered, but the angles of the arches must, I think, have shown margins of the stones, as certainly was the case in the Refectory and the later work of St. Katherine's Chapel.

In the south-west angle of the Little Cloister is a portion of the external wall of the east end of the Rere Dorter. Above a small eleventh-century window is a band formed of stones and tiles about 8½ in. square laid diagonally. The tiles are in the upper row next a fourteenth-century cornice, and it may be that they were set in at that time. In the Deanery what seems to have been the external face of the west wall of the Refectory is preserved and this has a similar diagonally chequered facing of tiles and stone. Here all the dark squares are of tile. This wall is surmounted by a band of fourteenth-century work, and I find it difficult to convince myself whether the chequers here are of this date or of the eleventh century. The wall may be of the earlier date but this is not certain, and even if it were the chequer work might, like the quatrefoil band, be a later alteration. The masonry part of the diagonal work on the wall of the Rere Dorter is certainly original. A similar band of diagonal work is recorded as having existed at Westminster Hall, and chequered masonry occurs in the tympana of the "Norman" triforium arches at Chichester Cathedral. The stone and tile facing of the wall in the Deanery is certainly an interesting and beautiful type of work, and the wall itself must be the west end of the Refectory range.

The old Chapter House must have been on the east side of the Cloister; it is described in a thirteenth-century poem as "a Chapter, in front towards the east vaulted and round." That is, it probably had, as Micklethwaite thought, an apsidal end to the east. Micklethwaite assigned it a position opposite the middle of the Cloister, in part on the site of the present Chapter House entry, but he gave the Confessor's Church a transept extending much further to the south than there is reason to suppose it actually did. In the upper floor, too, the "Norman" walls of the Dorter run on northwards of the position thus allotted to the Chapter House, which must, consequently, have been further north, thus lengthening the vaulted cellar by one or two bays.

The "Norman" doorway near the south-west angle of the Dorter and already mentioned was thought by Micklethwaite to have given access to a chamber, but it really opened to a spiral staircase and several of the upper steps still remain in place, although it has been destroyed below. Mr. Westlake suggests that it may have led to the cellar beneath, which was possibly a prison. It was built of fair masonry and was about 5 ft. in diameter. A flight of steps only 2 ft. 2 in. wide and a doorway not any wider would seem to be very narrow for the day stair to the Dorter. On the other hand, the wall had to be considerably thickened to take it. Fig. 3

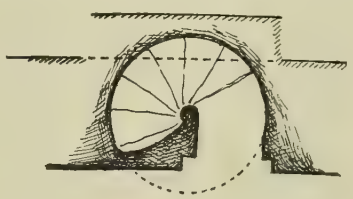

Fig. 3.

is a rough sketch plan of this. When some chambers against the outer side of this wall were destroyed the stair was broken into and a photograph shows that it must have projected considerably on the outside. I have little doubt that a stair of this importance opened from the ground floor passage. Micklethwaite thought that the Abbey prison was in another cellar near by; the day stair, he suggested, might have been in the entry to the Little Cloister occupying a central strip and only leaving narrow passageways on either hand.

Describing the entry to the Little Cloister, Micklethwaite said: "The roof is barrel-vaulted and there is a large oblong opening in it [it is now closed up] which has been made or left for some purpose, which may be recent, but it

is possible this is the site of the eleventh-century stairs to the Dorter. The stair would be carried on two walls and pass up a 'well-hole' in the Dorter floor. If the original stair was not here it is not clear where it was."

INFIRMARY.—To the east of the Dorter range, reached by the passageway through its lower story, are the ruins of St. Katherine's, the Chapel of the Infirmary.

Micklethwaite says: "It consists of a nave of five bays, with aisles and a chancel. It has been suggested that the nave may have been longer and have been shortened when the court-yard [now Little Cloister] was built, but the arcades [between nave and aisles] end with responds at the west end, so that the additional length must have formed quite a separate hall, as it did at Canterbury."

When I described the chapel in 1906 I had not noticed the fact that the western responds are bonded into the west wall in such a way as to show that this wall is of the twelfth-century work. I wrote: "the considerable remains of St. Katherine's, the chapel to the east of the Little Cloister, are of delicate late Norman work, almost transitional in character, which I should date about 1165–70. . . . The nave and aisles of this building were almost certainly continued westward over part of the present Little Cloister and included the Infirmary hall. (An infirmary cloister is mentioned in the thirteenth century.) . . . That the chapel of St. Katherine was the work of Abbot Lawrence seems to be shown by the fact that his anniversary was celebrated here, and one of the altars of the chapel was dedicated in honour of St. Lawrence. St. Katherine's was destroyed in the year 1571." I suggested that the building master was probably Alnoth, Henry II's master of the works at the Tower, the Palace, and Windsor. He was working at the Palace from 9 to 24, Hen. II. According to Ackerman, Henry II was a particular benefactor to Westminster, and the "New Works there." In the Pipe Roll 21, Hen. II, is recorded the payment of 40 shillings to Alnoth for works at the Refectory. He is elsewhere called *Ingenator*. Certain work to the King's great chamber in the Palace which had chevron mouldings around the windows must have been done in Alnoth's time.

The date of the chapel as given in *Gleanings* is c. 1160. Mr. Westlake also suggests "between the years 1154 and 1161." When I wrote before, I spoke of its "almost transitional character, which I should date about 1165–70." I am now still more impressed by the advanced character of the work and should say not earlier than 1170–75.

Enough of the chapel remains to allow of a paper restoration. (Fig. 4). The columns were 2 ft. in diameter and about 12 ft. high. They were alternately octagonal and round, corresponding on each side of the "nave." The capitals were scalloped and varied slightly; the arches had various forms of chevron decoration. The western responds are fully bonded to the wall, and there was fair bonding masonry also at the angles of the structure. (See Fig. 4). The chancel arch had small attached shafts. The window jambs had round mouldings with small scalloped capitals at the angles (Fig. 5*b*).

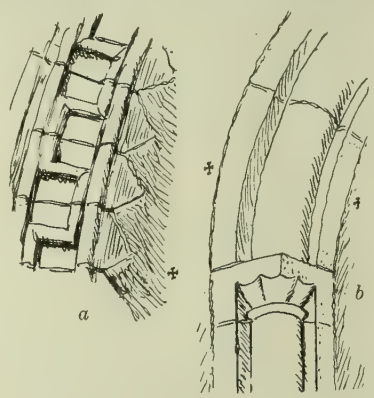

FIG. 5.

The wrought masonry of the jambs and arches showed, while the wall surfaces of rubble were covered with plaster, which was finished to a line against the windows. The splays were also plastered in a similar way, leaving a margin against the outer stonework. The soffits of the "nave" arches also had strips of thin plastering, finished with zig-zag edges against the margins (Fig. 5*a*).

Over the arcades were stone wall courses carved with a zig-zag, of which only a few hardly recognisable fragments remain. Under the window cills is a half-round string moulding. The roof was evidently of the hall type, that is, in one span over the whole width. I have a note that traces of the "lining out" of the interior wall surfaces in red were found, being the ordinary "masonry pattern" with a segment (quadrant?) in the lower left-hand angle of each rectangle. Altogether, this chapel is a very refined example of transitional work. The fourteenth-century doorway in the west wall is at a higher level than the chapel floor, and I have little doubt that the jambs of the earlier door would be found beneath, if searched for.

According to Scott, in *Gleanings*, "The Infirmary proper (the Hall) is gone and m been destroyed when the small cloist built. If so, it no doubt extended w to the wall of the dormitory. This, h would be disproved if the small cloister proved to be earlier, which Widmore i it to be. In that case, I should imag infirmary surrounded it."

Mr. Westlake gives some further evic show that the hall for the sick was to t of the chapel, and he suggests a restor which it covers the whole of the preser Cloister, and is several feet wider than i would be a very large hall for the West monks. Moreover, there seem to have be rate houses or chambers as well. Its so angle as suggested abuts on the early "N masonry of the Rere Dorter, and I do n that there has ever been the attachme wall here. The mention of the In cloister. Mr. Westlake would apply to the entry.

Such record as there is of the Hall that it was an inferior work to the Cha possibly of earlier date. We have seen t Chapel was entirely separated from it by wall. Altogether, I would accept the mary Cloister" as meaning a court, and that the Hall was much inferior to that by Mr. Westlake.

Mr. Westlake quotes an order issue 1268 that the Prior should no longer occ chamber "before the door of the in next the infirmary cloister," except in (p. 443). "Whether the structure of t room was of the same solid character as the chapel itself may well be doubte infirmarer was evidently much grati record that the pulling down of the ol ment provided sufficient fuel to save hi purchases for two years."

On the plan (Fig. 6) is shown how a a smaller but seemingly reasonab

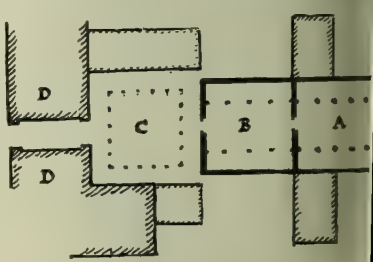

FIG. 6.

indeed, as wide and nearly as long as the of the chapel, would leave room for an I Cloister. A is the chapel with known projecting from it; B is the infirmary suggested; C is the little cloister with bers" and "houses" accessible from DD shows the Dormitory range of b The projection shown to the south of th is a later and still existing resident probably the Infirmarer's. The p opposite on the north side is only repres some fragmentary ruins; one is a carv of the fourteenth century.

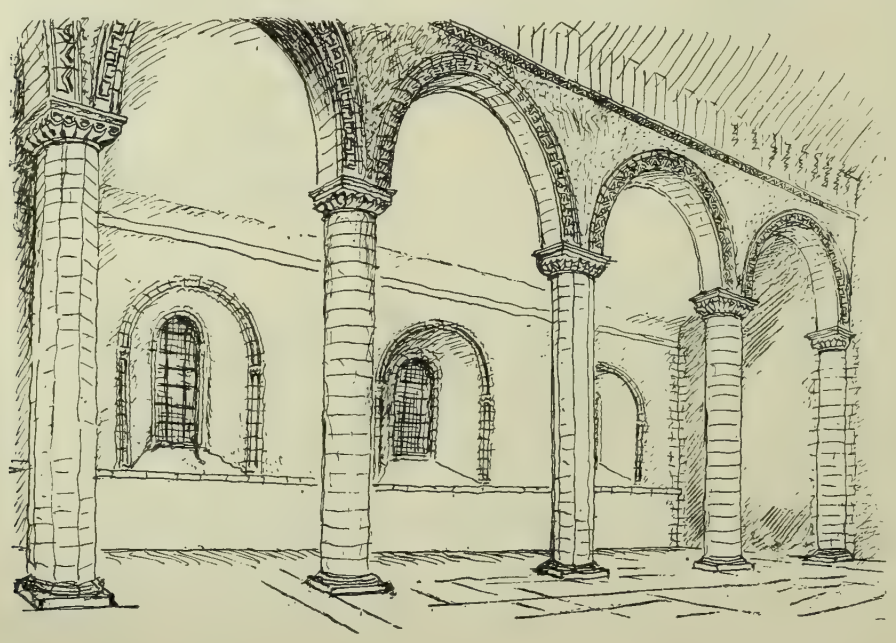

FIG. 4.

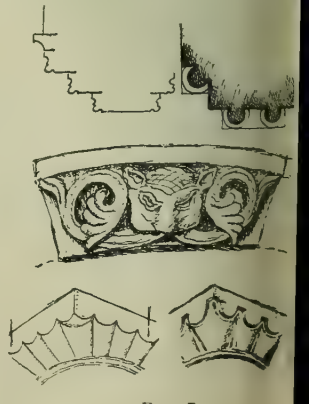

FIG. 7.

ng a great number of "Norman" carved preserved in the museum, there is one from its style, may have belonged to therine's Chapel. This is a voussoir of h order or label moulding carved with nust have been a repeating unit. (Fig. 7.) ne from an arch of considerable width, ly the Chancel arch of the Chapel which, see, is of such a plan that the arch must een in several orders. (Fig. 7.) The style nearly approaches the work of the west f the Temple church. Diagrams of the of the main capitals are also given on

In the store of fragments is a stone an interlacing arcade of remarkable ter, which looks as if it might have come St. Katherine's. (Fig. 8.) The chevrons

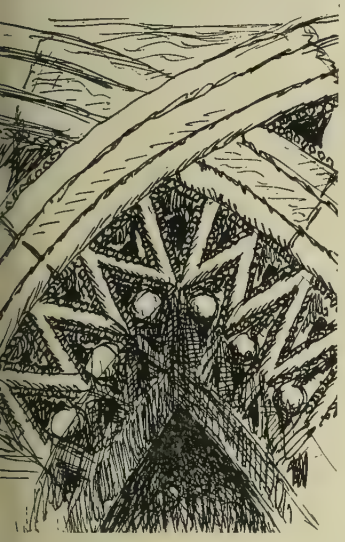

FIG. 8.

t so much from the ground that they seem cut. I may also here mention that in useum is preserved the half of a large man carved capital for a shaft of 2 ft. 4 in. ter. From a sketch of it given me by Weatherley it appears that it was found Chapter House (works) in 1868. I give 9 a sketch of an elaborate and beautifully

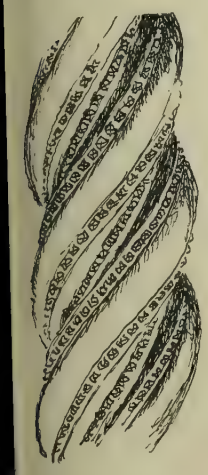

FIG. 9.

shaft, probably from a door jamb; the oll-moulding is coloured red. In *Glean-* illustration is given of an elaborate d stone found under the nave in 1848. is from another stone of the same kind, h a different and beautiful pattern.

CLOISTER.—Many Norman capitals about t cube in size are preserved among the its and some have been fitted into the ngth of Cloister arcade which has been n the museum. Some of these capitals

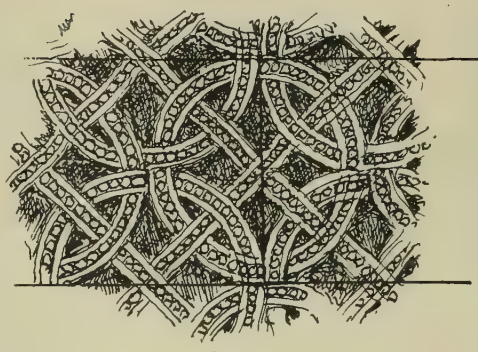

FIG. 10.

have sculptured figures, others are carved with scrolls, and interlaces of foliage, and others are a developed variety of the cushion capital. Many of these were found when Scott practically rebuilt the outer walls of the west and south cloister walks, and as he saw they must have belonged to the ancient cloister. There are also some early bases 16 in. square which bore

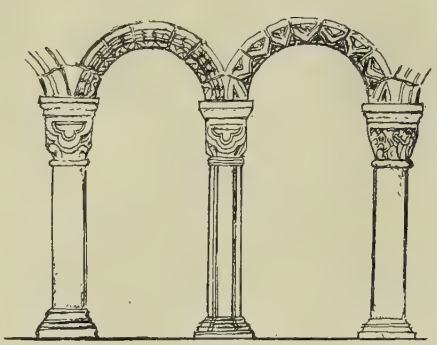

FIG. 11.

a shaft nearly 8 in. in diameter, a size which exactly suits the capitals. Other bases of the same scale were finished for shafts of quatrefoil form shown in Fig 11. Now some of the capitals are also of quatrefoil form above the necking (Fig. 12). About 1909 I looked for shafts of the form required and found one which seems to have been of the full original length. Again in 1911 another piece was found in the later masonry of the south cloister. A little later the dwarf wall of the arcade of the western walk

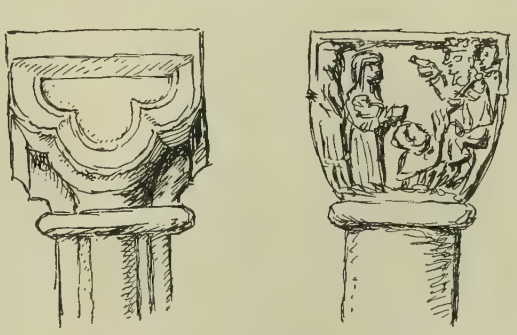

FIG. 12.

was found beneath the grass nearly parallel with the present cloister: the capping slabs were 1½ ft. wide and on them were traces of the bases of the old arcade of narrow arches. (Some half-bases and capitals suggest that the arcade was broken into groups between piers.)

Later again, in removing accumulated earth and stones from the Dorter cellars a large number of stones from narrow arches decorated with chevron work were found, and with these we were able to complete the short length of arcade. The manner of work is rich and the elaborate cushion capitals are similar to many in the Reading Museum found in the Abbey ruins of that town. We might date these capitals about the middle of the twelfth century. A capital of the same type, however, found at Westminster outside the Abbey, which obviously belonged to the sculptured series, had a carving of an Abbot receiving a charter, together with an inscription naming William the Second and Abbot Gilbert. This would seem to date the work between 1087 and 1100, which is impossible. Either the inscription must have been faultily restored, or it was retrospective in its character. I suggest that there was a series of capitals recording Kings' gifts. This capital was sold to a collector and has been entirely lost.

Of the other sculptured capitals which are preserved, one is carved with the Judgment of Solomon, another has Devils and the Jaws of Hell, while a fragment represents two dragons biting at a woman's breasts. This is the symbol

FIG. 13.

of one of the Vices (*Luxuria*) and suggests that a series of the virtues and vices were represented. Fig. 13 is a partial restoration of this interesting fragment. So far as I know no other figure of the kind exists in England. On the return side there seems to have been a devil seizing a person.

Fig. 14 is one of the foliage capitals, and a magnificent work of art it is.

REFECTORY.—The north wall of the Frater

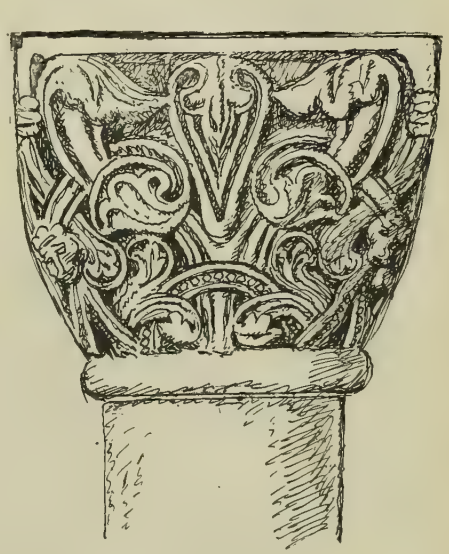

FIG. 14.

stands its full length and height. In the upper part fourteenth-century windows have been inserted in the place of the old ones, which, doubtless, were similar to those of the Dorter. A Norman string mould of rounded profile still remains beneath the windows. Below ran a continuous wall arcade; the ground on the site had accumulated so that in the excellent engraving given of the wall in *Gleanings* it looks as if the base of the arcade were at seat level. It has been further exposed since, and even now the

original floor level is about 1½ ft. below the grass The base of the arcade was originally about 7 ft. above the floor. The capitals are of simple block type, square above and conical below, and the bases are plain splays.

A further portion of the arcade was also found on the south side in the present song-school about 1912. On the soffites of arches was some thin plastering, which left 2 in. of the stone exposed at the margins; there were traces of red, and doubtless the whole was originally washed and lined into blocks. When fresh and fair it must have been a noble barn-like structure —as barns were in the Middle Ages.

The exterior of the wall appears over the South walk of the cloister, and in repairing it, about 1912, some sound masonry was found, many of the stones of which still retained their mason's marks (Fig. 15). These were similar to

FIG. 15.

others on the west wall of the Dorter, by the entrance to the Pyx Chapel, and one seems to occur in both places. The external walls of Westminster Hall were also plentifully scored with these marks. From the character of the work and these marks, and the fact that the little arches of the wall arcade seem to have had alternate voussoirs of two kinds of stone, it must have followed on the Dorter at once and doubtless was an eleventh century work. If the inscription on the capital mentioned above is to be trusted, it appears that the Refectory was built at the cost of William Rufus. Probably the same building master was employed at both the Palace and the Abbey. A full and clearly illustrated account of eleventh and twelfth-century Westminster would be a romantic contribution to English history.

The Refectory needed serious repairs after the great fire of 1298. References to works appear from 1301, and in 1305-6 master Edmund the Carpenter with sixteen to nineteen other carpenters and several sawyers and labourers, were engaged on the works—doubtless a new roof. An archway of very refined earliest fourteenth-century work near the south-west angle, which communicated with the kitchen, and a low vaulted building to the south of it, of which shafts and bases (c. 1300) remain, are likely to be of this time. Master Robert Cementarius receiving 9d. a day, who is mentioned in connection with the repairs (Rackham), was probably the master mason of this work, and to him I would also assign the pretty two-light windows in the "Norman" openings of the Dorter, which also followed on the fire. This work is very delicate and beautiful, and I am glad to make the acquaintance of Master Robert. A plan of the low vaulted building just mentioned is given by Mr. Westlake. The columns were 15 in. in diameter, and only 6 ft. high. The vault rose 4 ft. higher. It was very like the entry to the Chapter House.

Some considerable works in the Refectory seem to have been undertaken at a later time by Litlyngton, Prior and then Abbot (1350-85), whose arms are on some of the floor tiles found here. The roof corbels are very like those in the Abbot's Hall. I have thought that the elegant two-light windows in the north wall were of an earlier period, about 1310-20, but I now think that they are Litlyngton's work. The rebuilding of the cloister may have given occasion, by blocking the lower part of the "Norman" windows for inserting new ones. There are several fragments of tracery in the triforium, from which I have been able to assemble a three-light window of exactly the same style and scale as the others, which probably came from a gable end of the Refectory (Fig. 16).

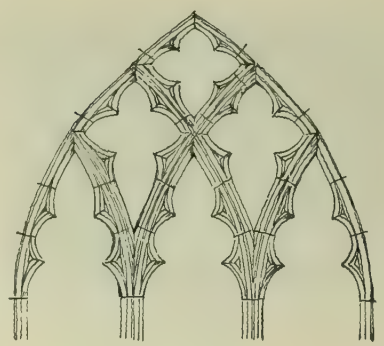

FIG. 16.

In this form the work looks later. There is also at the east end of the Refectory a wall-arcade, which appears fully as late as, say, 1360 (Fig. 17). Again, the shafts of the inner jambs of the two light windows are like those of the Refectory door, which it seems impossible to date before the middle of the century. This door resembles in feeling the doorway to the Chapel of St. Katherine. On the inside of the west wall of the Refectory (the chequered wall) remains the base of a window jamb at the height of those in the north wall and probably the jamb of one of the three light windows (Fig. 16). The quatrefoil band on the exterior of this wall above the chequers may range with the parapet of the Refectory.

At the south end of the arcade (Fig. 17) is the springer of a door-like arch, which is doubtless part of the Reader's pulpit. The arcade ranges with the "Norman" arcade, and was obviously part of the general scheme of modernising the great hall. The "Norman" arcade is itself walled up flush, and the abacuses were cut down to the face of the wall; evidently it was

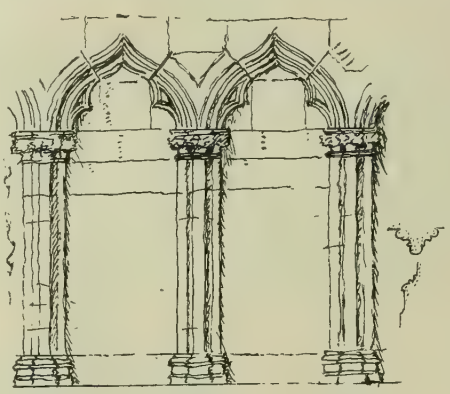

FIG. 17.

obliterated and the Refectory was *completely* transformed into a fourteenth century work, of which the doorway and windows made part. The roof corbels are long, heavy stones, which pass through the whole thickness of the wall; over the top of each there seems to have been an extra carved stone (see plate in *Gleanings*). From their position it would seem that the roof cannot have been of the hammer-beam type; it was fifteen bays long. We may now imagine the complete recasting of the "Norman" work, a precedent which was later to be followed at Westminster Hall.

Perhaps we may assign all the masonry to John Palterton, who was master mason in 1349, and can be traced until 1373–4, and inserted the doorway into St. Katherine's Chapel in 1361. The masons of the fourteenth century who preceded him were, the master Robert mentioned above, say, about 1300-10, and Walter de Bole, working in 1349.

Other masons recorded about 1300 and soon after are Richard (1299), Maurice de Tothill (c. 1316), and Alexander de Tothill.

A WANDERER IN LONDON

The twenty-third edition of this pop work* has just been issued in a revised f Among the changes are new description accordance with the post-war rearrange of pictures in the National Gallery, the Gallery, and the Wallace Collection. It is misfortune of so many guide-books that are so severely practical; it is the charm Mr. Lucas's book that it represents the pressions of a wanderer. In guiding u takes us to the things which he assumes will appreciate and like, and we flatter selves that his personal likes and dislikes ours also. There are no suggestions for t who merely wish to record the fact that have "seen" everything; but even they at least succumb to the written charm of book. Readers who are familiar with Lucas's writings will realise that they being guided through the various picture leries by a genuine lover of painting.

To architects and builders a book of nature should be invaluable; it might, in opinion, be even more valuable if we had the feeling that Mr. Lucas's affection architectural antiques may have a tend to cause him to ignore the new. He give the charm of the quiet, unassuming Geor houses in their quiet streets, and even i assume that age and sentiment have ve them with an individual charm of their we admit we are not optimistic enoug believe that time will soften the crude noisy modern substitutes which offend Lucas. He would probably deny any c to be a professional architectural critic, he is certainly a very cultured critic, some of his architectural criticism der that he has a fine conception of architec principles. Here is an example:

"Too many London architects dislike l restful, unworried spaces and long, unbr lines: hence many of our new buildings been for the most part fussy and ornam and not at all, I think, representative o national character. Somerset House for its fiddling little cupola) and Ca House-terrace are perhaps London arch ture at its simplest; the Law Courts, wit their amazing intricacy and elaboration London's public architecture at its most plex and unsuitable. St. James's Pala beautiful, but Buckingham Palace hardly be more commonplace."

St. Paul's Cathedral has no religious nificance to Mr. Lucas; it has neither te ness nor mystery, and its true appea considers, is external. There are many will agree with these feelings, and we believe that they represent an attitude of since there are also many to whom St. P makes a religious appeal where the C cathedral fails. Probably Mr. Lucas is lover of the Renaissance style of archite in all its phases (the old Georgian house evidently an exception), but it is diffic argue from this that "Wren, of course no religion." It is a more pleasing th —and probably more correct—to imagine Wren worked in the style which he and believed was capable of the higher pression of Christian symbolism. C architecture is still a pagan style to people, and Mr. Lucas's impressions ar cidedly interesting and worthy of cons tion. We agree with him when we c that at certain times the lighting of St. P is almost commercial.

His comments upon the many phas London make delightful reading; if critical he is sympathetic, and inva deals gently with our human foibles. excuses his architectural digressions o plea that his pen ran away; we would that it did it more frequently.

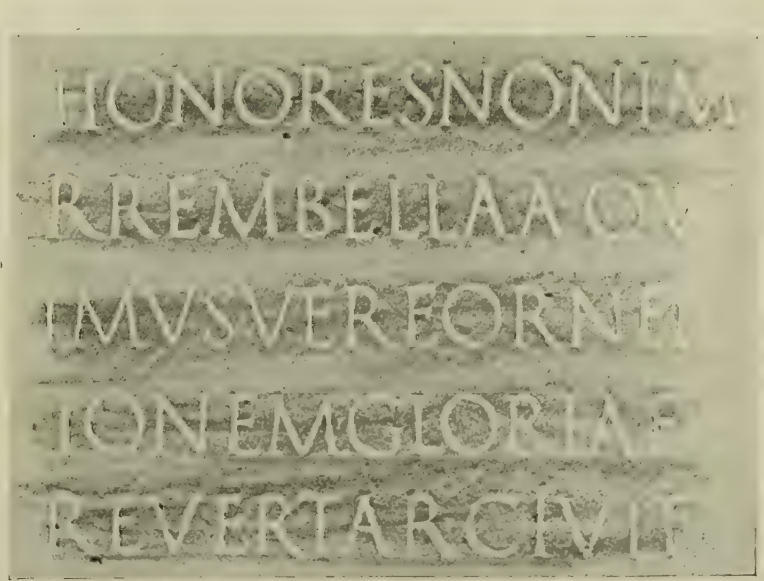
MOHAMMEDAN ARCHITECTURE IN EGYPT AND PALESTINE *

many years Mohammedan architecture eived considerable attention from the cts of Western Europe, and as the f their efforts, and particularly of the gable labours of such students as , Saladin, and Migeon, we have now disposal an immense amount of well- ted literature on this fascinating subject. as been augmented recently by "Les ents Mauresques du Maroc," by J. de la , and "L'Architettura e L'Art Musul- n Egitto e nella Palestina," by Ugo published in Paris and Turin respec- both profusely illustrated ; and by the before us. There is a sufficient thread of lance running through the whole of the ture of Islam in Palestine and Syria its progress through the ages and under ious rulers—Arab, Sassanian, Mameluke, rkish, by whom it was fostered—to with a distinct impress. Apart from its aditions and requirements, its growth ubtless influenced by the customs and traditions of the peoples who came ts sway or with whom it came into direct . Thus Byzantine, Syrian, Coptic, an, and Indian influences can all be ly traced in its buildings, while indi- initiative appears to be no less clear.

author traces the history of his subject e birth of Islam to the period subsequent Turkish conquest of Egypt in 1517, g a chapter each to the first mosques, the xecuted under the governor of Egypt ūlūn), and that under the several rulers Fātimids, Saladin, the Turkish Mame- the Circassian Mamelukes, and the This is followed by most interesting luable chapters on domestic architecture, ornament and craftsmanship. It is a treatment of the subject, and shows painstaking and research, supported by l investigation made while serving in and Palestine during the late war. The s illustrated throughout by a fine series r and large-sized photographs, and by gs made principally by the author. ains copious bibliographies and a useful , and is produced in attractive binding. Arabs of the early period were evidently different artists, making use of such ls as was provided from the pillage of ncient buildings, and of the impressed of the races they subdued. Details are und misapplied, as a Corinthian capital and used as a base ; or columns them- were even reversed. But in process of reater skill was shown, and in the great of Ibn Tūlūn, at Cairo, finished in 879, re introduced for the first time in place ns. A good story is told by an early -century writer of the occasion of rm. Ibn Tūlūn was building an aque- convey water from the Muqattam hills ity, and as he was riding out one day desert to inspect this work his horse d in a heap of mortar. He immediately ed the architect of the work to prison neglect, ordering five-hundred blows ministered in place of the five-hundred he to him. Some time later the governor to build a mosque on a magnificent t when he was told that it would hree-hundred columns to erect a mosque e he required under the usual method ruction, involving the destruction of number of provincial churches, he to authorise the work and it lay in . This state of affairs came to the ears nfortunate architect of the aqueduct, still languishing in prison. He wrote vernor offering to build him a mosque uired size without the use of a single ave those on either side of the mihrab. rought before the governor, described his scheme, and Ibn Tūlūn was so delighted with it that he ordered the architect's immediate release, arrayed him in a rich robe, and paid him the sum of 100,000 dinars to enable him to commence the work forthwith. The piers of this mosque are rectangular on plan and have engaged columns formed out of the angles. They are built entirely of brickwork and covered with stucco.

That the influence exercised by the Crusades on Islamic architecture was very considerable is abundantly clear from the existing remains. The minaret of the White Mosque at Ramlah (which is illustrated opposite page 104), is a remarkable example of this influence. This minaret was built in 1318, and has all the characteristics and appearance of a Gothic church tower of the period. At Jerusalem and elsewhere in Syria are other and scarcely less striking examples of this influence, quite apart from the Christian churches, as at Gaza, Ramlah, Ludd, Samaria, and Jerusalem. which have been converted into mosques. The period of greatest magnificence was evidently that of the Turkish and Circassian Mamelukes, from 1250 to 1517. The mosques, colleges, hospitals, fountains and tombs erected at Cairo and in Syria during this period, including the mosque of Mu Ayyad and the collegiate mosques of Qāyt-Bay, of Abū-Bakr Ibn-Muzhir, and of Al-Ghurī, all at Cairo and all illustrated and described by the author, are most noble works of art, richly embellished with both plastic and applied decoration. The foliated and geometrical decoration carved out of the stonework on the outside surface of numerous domes at Cairo, of which the dome of the mosque of Qāyt-Bay is a fine example, or the zigzag or fluted treatment adopted in other cases are equally striking.

We could wish that in some of the descriptions a more direct relationship was established between the text and the illustrations. However well worded a description may be, it becomes much more lucid when direct connection is maintained with the illustrations and when the illustrations are chosen with this end in view. Perhaps this defect is most pronounced in the disquisition on the origin of the Mohammedan dome (pp. 194–197). In this case, though numerous domes are referred to as examples of the remarks made, only one reference is given as to the page on which an illustration of the dome would be found. We would also point out two slight printer's errors on p. 48, line 27, and p. 78, line 28.



The chapter devoted to domestic architecture contains descriptions of Mohammedan dwelling-houses of the periods under consideration such as exist at Cairo, Damascus, and in the towns of the Delta, and of the tenement houses or Rabs, the khāns, and the shops in the bazaars. The description of the peculiar arrangements and plan of a typical house in Cairo during the mediæval and later periods is most interesting, and it must be a revelation to many not already well acquainted with the subject to realise the rare beauty of decoration contained within the walls of these dwellings, in mosaic pavements and marble faience lining, apart from the attractive and picturesque character of their exteriors.

The prohibition by Mohammed of the use of human and natural forms in religious art has resulted in that prolific employment of formal foliage and geometrical forms which is characteristic of Saracenic ornament and which has produced most charming compositions. Relief was also obtained by the use of alternate courses of stone of different colours or, in later periods, alternate artificial colouring, both for the horizontal courses of walls and pillars and for the voussoirs of arches. That much of the internal decoration, as of large wall surfaces covered with enamelled tiles employed in some of the mosques, is much too brilliant and insistent to be reposeful or pleasing to the Western mind must be acknowledged, but the mosaic and marble pavements, the inlay work on pulpits, reading desks and other furniture, and the fine grills are all works of great beauty and deserve careful study. As a valuable contribution in English on this subject Mr. Briggs' volume is heartily welcomed.

EXHIBITION NOTES

The private view of portraits and studies by P. A. de Laszlo, at the French Gallery, was crowded with interested visitors from the fashionable world, who, we suppose, accepted without surprise the pictures of so many good-looking people. One would imagine that the artist is particular about having good subjects, but he certainly can set forth in a fascinating way both men and women who have a decent share of good looks. The men one feels inclined to take for granted; but are the women really as fascinating as the painter makes them?

Rubbing from Bronze Tablet found at Lyons, bearing parts of a speech delivered in the Roman Senate by the Emperor Claudius.

By Mr. F. W. Knight, A.R.I.B.A.

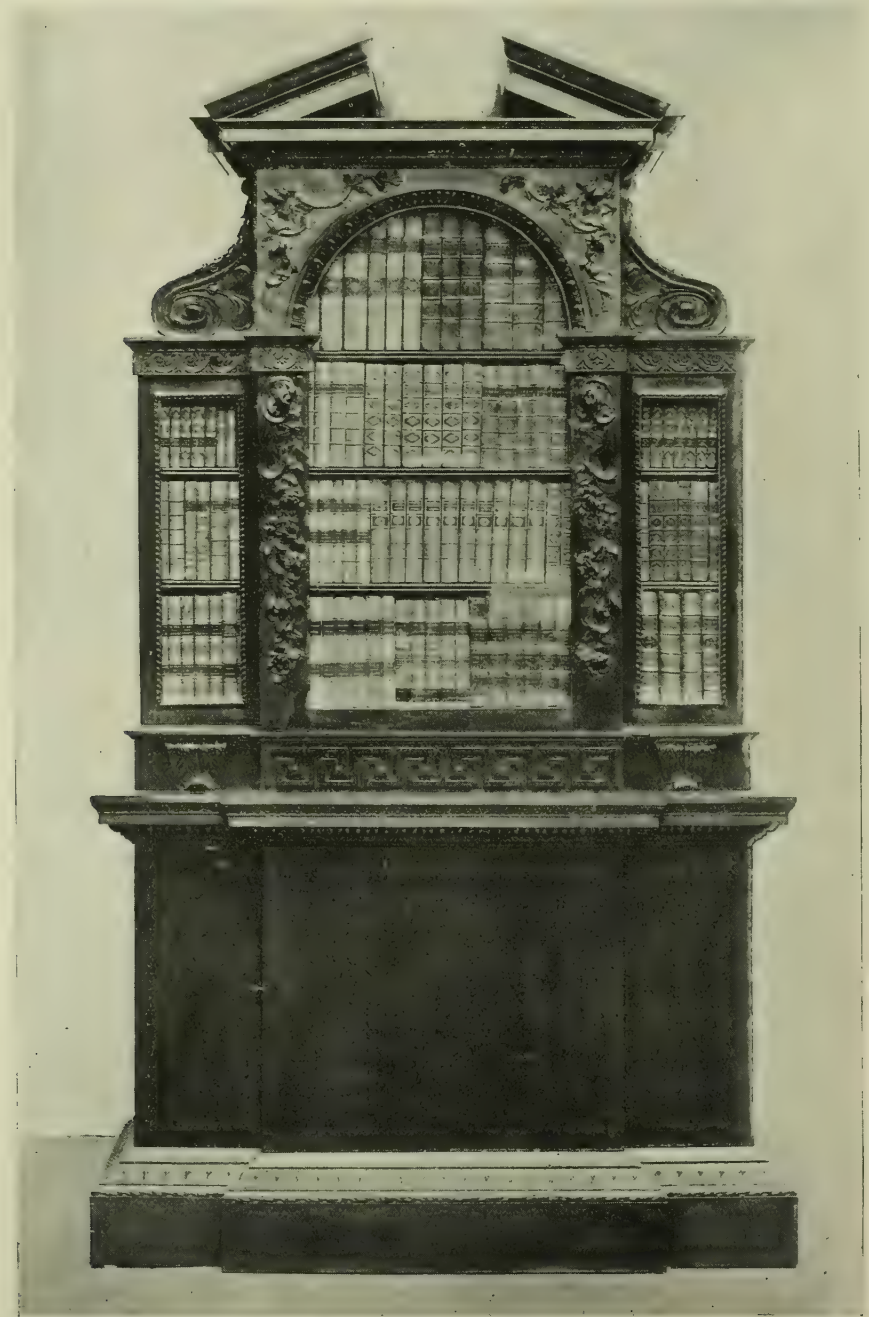
THE DECORATIVE ARTS IN ENGLAND*

COLONEL MULLINER'S "Decorative Arts" is a catalogue *raisonnée* with a difference, which even a superficial glance would reveal. To take the furniture sections alone, after reading the first few pages, the reader realises that the author has a marvellous grasp of his subject, and has written a real furniture book in quite unconventional form. The more usual method is to write the book more or less chronologically, and then to illustrate the text by the aid of appropriate plates. In this case, the author has taken some 250 specimens from his own superb collection, giving each one a concise and quite lucid description in catalogue form, adding thereto further details as to provenance and workmanship of the piece illustrated and historical data concerning the particular type or period. There is in every case an uncrowded page of such text opposed to a page of illustration—a virtue in make-up.

The twenty chapters deal with Furniture (1-6), Woodcarving, Chandeliers, Silver, Medals, Stuart Enamel, Locks, Battersea Enamel, Ormolu, Glass, Tapestries, Needlework (each one chapter), and Bookbindings (18-20), each commencing with from one to five pages of historical matter. The text is of much interest, and, together with the fine illustrations, should satisfy the most fastidious connoisseur.

The author adds a short note in which he says, "My object has been to embrace for the first time in one work representative examples of various decorative articles produced in England during the late seventeenth and the eighteenth centuries, as the more comprehensively the subject is treated the more interesting it appears, and the more readily it is unde No work covering such a wide field can p be complete. For instance, I have no with costumes, pottery or porcelain; and ings, pastels, mezzotints, engraving jewellery are entirely omitted." Doubtl author could have handled these missing s quite satisfactorily; but he has c himself to a selection from his own co which is—or rather was—quite priceless as it went. Under this limitation, in Cha "Furniture under the French Rococo In 1740-1763," the reader has to be conte example, in the mahogany of Chippen the Chippendale school with but nine illust comprising three chairs, two commod wardrobe, a table, and a cabinet, and, but one "three-chair-back" settee in taste; and how much we should like had an equally fine three (or four)-cha settee of interlaced ribbon or Chinese work! Again, in clocks, we are restri three, of which two are by Thomas T We have no quarrel with Tompion, who the top-note in the collector's gamut, are greedy for something by his pupil, Graham, who sleeps in the same grave nave of Westminster Abbey.

In Chapter III, "Furniture und Classic Revival, 1763-1790," we ge examples of English furniture directly i by French models, and some half-doze designed by Robert Adam or influenced genius.



The Bureau Cabinet of semi-archi design (figure 31 in the same chapte superb combination of the arts of the maker and painter—the central lights o Gothic tracery in the break-front cabi mounting the bureau being decorated with emblematical of the three cardinal virtu titude, justice, and temperance—from the by Sir Joshua Reynolds, for the window College, Oxford; whilst the painting of amorine sacrificing a goat in the p suggests the work of Pergolesi. The pro of this fine effort of craftsmanship is r gested in the text; but we can visu appropriate first home in the Adelphi perhaps No. 5, under the ceiling pai Zucchi and facing David Garrick's marble chimney piece, which is said to h £300. It is interesting to compare this l graceful structure of mahogany, overl inlaid with satin-wood, tulip wood an with the cabinet of purely architectural plain mahogany (Fig. 15), relying f upon its broken pediment and carving pattern, rope ornament, Vitruvian sc pendant flowers.

The chapters on Lacquer and Marqu particularly illuminating, both in t illustrations. We are shown quite cl difference not only between purely Chi purely English lacquer, but also bet interesting Anglo-Chinese varieties some cases exhibit purely Chinese imposed upon English made cabinets others, English designs executed by lacquerers, who inevitably gave the clad figures distinctly Oriental coun

In dealing with Marquetry the auth this interesting form of decoration ba thirteenth-century intarsia or inlays o which spread to Florence and othe cities and reached the French towards t of the seventeenth century. We ar the elementary English inlays of T early Stuart times, and are given illust delightful examples of somewhat late tions in this country, with bold inla patterns influenced by the Dutch; a clearly the tulipomania of the Ne reflected in our English tables and Again, we have examples of delicate cate "endive" or "seaweed" m of late seventeenth and early eighteenth resembling the Arabesque designs in shell and brass of the contemporary

In referring merely and quite shor furniture items, we have but touched of the matter; but we have endea indicate the scope of the book, which

to furniture lovers and in no small to virtuosi generally.

decorative arts were perhaps at their in England under the influence of Wren, houses, churches and public buildings aced by the inimitable carvings of Gibbon, Brothers Adam, whose designs in furniture r houses were carried out by the master an, Chippendale II, and his contem-s. History repeats itself in our own day, r Edwin Cooper designed the new home Port of London Authority, on Tower d makes himself responsible for its entire ings.

late Colonel Mulliner was a notable mongst connoisseurs. Possessed of an g judgment—and perhaps a very deep —he was doubtless well in the way of ng and (under a continual process of n and rejection) of amassing an almost collection. We regret that, dying but onths ago, he did not live to see the tion of his book. The disposal at 's, on July 10, of 146 lots of "The r Collection of Old English Furniture, of Art and Tapestry," realising some , was evidence of his catholicity of nd judgment. One hundred and two of ts—approximating to £34,000 under the eer's hammer, ranging from 17 guineas tuart Disc of Enamel, to 3,500 guineas Chippendale commode—were selections e items illustrated and described in the nder review, as were also the fifty-seven silver which were sold at auction on the s day for £10,698. We could have the best of the best examples in our l collection to fill regretable gaps, the collection could not have been l as a whole. "*Hinc illæ lacrimæ!*" have the book to remind us of what have been.

BOOK REVIEWS

ey Friars of Canterbury. By CHARLES TTON. (Manchester: The University ess.)

monograph, issued by the British Society ciscan Studies, traces the progress of the riars at Canterbury, from their arrival city in 1224, to the dissolution of their n the sixteenth century. After living y in meanly constructed dwellings for ty years, they received a grant of land from John Digge, a wealthy citizen of ury, and on this they proceeded to eir conventual buildings, the remains of still exist. The author has evidently much time in painstaking research the documents which bear upon his with the result that he has collected here luable information. In respect to the ural restoration of the plan of the opposite page 24, the disposition of unconvincing, having regard to the plans of the churches of the Mendicant but it is hoped that further investigation ow more light on this subject. The last is devoted to an illustrated description storation, effected in 1919, of the charm-e building which stands astride of the tour, and which is the only remains of blishment now above ground. Appendix abstracts of wills of benefactors to the .396-1538) is a most valuable adjunct work. The volume is supplied free to s of the Society by whom it is issued. rticulars of membership of the Society obtained from Dr. Walter Seton, Hon. y and Treasurer, at University College, reet, London, W.C.1.

e Mouldings: Full-size Sections of lded Details on English Furniture from to 1820. By E. J. WARNE. (London: est Benn. Ltd.) Price 25s

s when machinery plays so paramount a ne production of mouldings of all kinds he first importance that all those con-n the design of furniture should thor-rasp the true principles of the applica-tion of mouldings, the relation to each other of those in juxtaposition, and their proper disposition on the particular piece of furniture to be made. For this purpose the study of the best types is essential and the volume by Mr. Warne is a welcome contribution to this end. It contains illustrations of about one hundred and forty pieces of furniture, including bedsteads, various forms of cabinets, bookcases, cupboards, chests, tables, sideboards, mirrors, and clocks. These are made of oak, walnut, mahogany, satinwood, pine, marquetry, and lacquer and comprise examples of English furniture extending over a period of about 250 years, from an oak armchair of about 1574 to a mahogany table of about 1820. All these are well illustrated by full-size details and by a thumb-nail sketch of each complete piece on which the positions of the several mouldings are indicated. The examples are admirably chosen and are representative of the various types, and the author has advisedly arranged them in order of types of furniture and not chronologically.

Architecture in England. By CYRIL DAVENPORT, F.S.A. (London: Methuen & Co., Ltd.) Price 6s.

In its treatment of the history of English architecture, this manual follows the usual sequence of periods, Norman, Early English, Decorated, and Perpendicular, each period being illustrated by examples drawn from cathedrals and churches. Cursory descriptions of the examples selected follows a foreword on the style of each period. There is an introductory chapter on Roman and Saxon remains and a concluding chapter on the Renaissance period. A short glossary of architectural terms is appended. Presumably, there is no pretension in this work to supplement what is already known, but rather to popularise the subject. The line followed, however, is over well-trodden ground, and it can scarcely be said that we have here anything more simple, compact, or anything superior in erudition or illustration to many of the manuals already published on the same subject. The volume is illustrated by photographs and drawings by the author.

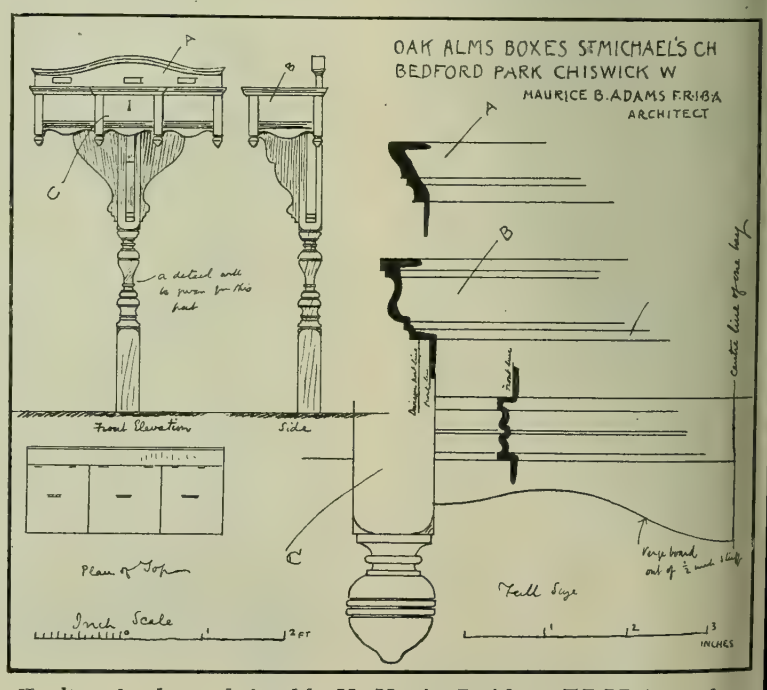
A Bureau Cabinet.

AN OPEN-SPACE POLICY FOR GROWING TOWNS



By J. P. ORR

THE expansion of a town from the nucleus of its original built-over centre generally takes place along the main roads, railways, or navigable waterways leading to the surrounding trade centres. Land situated on these routes gets its prospective building value sooner than land situated in less accessible areas between them; but in course of time these areas are made accessible by new cross roads, radial roads, or railways, and are developed for building; and so the built-over area is always expanding outwards in the shape of an octopus, the main centre always growing larger, while the original built-over tentacles keep stretching farther and farther out, and new tentacles keep coming into existence wherever new roads or railways are constructed. Agricultural land which had, say, a value of £60 per acre when it was two miles outside a town, might, when the town had expanded nearly up to it, have a value of £600 per acre as building land. The advance from £60 to £600 would be more or less rapid according to (i) the situation of the land with reference to the built-over town; and (ii) the rapidity of the town's expansion towards it. During the first few years of this expansion the land in question could perhaps be put to an agricultural use only, and yet its value would increase because a purchaser would allow for the prospect of being able to sell the land after a few years for building purposes. There is generally an intermediate stage before the building stage, viz., that in which land is in demand for recreational purposes. It has then a value considerably higher than that of similar agricultural land further out, but considerably lower than that of land newly appropriated for building. Were there no chance of its being in demand for building, it might have a value of, say, £200 per acre; but the prospect of its being required for building a few years hence may perhaps raise this value to £350. The average landowner is, of course, out to make the most for himself out of his land. He does not generally think of the interests of the community. So the man who buys land at £350 per acre will generally let it for recreational purposes only for a short term. He reckons perhaps that by the end of that term (1) the built-over area will have crept much nearer to his land and will have absorbed much of the land now used for recreation; and (2) the demand for recreation grounds and perhaps also for building sites in the vicinity of his land will consequently have increased, so that he will be able to raise his recreational rent or lease or sell his land at great profit for building. Occasionally, a landowner may be found sufficiently public-spirited and sufficiently interested in sport to reserve part of his land as a permanent open space. He may, even without being at all public-spirited, make such a reservation from consideration of the increase in value of one part of his land if another is kept permanently open; but experience shows that, in the ordinary course of events, suburban land under private ownership is put to its most paying use, so that, though part of it may for a few years be used for recreational purposes, the bulk of it is ultimately appropriated for building. If, then, the ultimate needs of a growing community in the way of open spaces (including both roads and recreation grounds) are to be adequately provided for, it is evident that the private land needed must be acquired by some public authority, and that in the interest of economy it should be acquired long before it has reached its full building value. This calls for far greater prevision on the part of local authorities than has ordinarily been shown in the past in, *e.g.*, Greater London, and emphasizes the need for careful and comprehensive regional-planning of suburban areas far in advance of their actual development for building purposes. Early action is specially needed in respect of land which lies between two or more expanding centres, because the advance of buildings towards it is from several directions, and tends, therefore, to make its advance in value all the more rapid. When a town is expanding outwards into open country all around, the temporary recreation grounds in its outskirts are driven gradually farther and farther from the centre; but when a town, and one or more of its suburbs, are expanding towards one another, there comes a time when all the intervening land has become too valuable to be used for recreation, and then the substitution of new for old temporary recreation grounds for the main town involves not a gradual move but a sudden long move to the far side of the suburbs, to the disadvantage of everyone concerned except the railway and omnibus companies. This ought to be guarded against by a far-seeing regional plan; but the needs of the future population in the way of permanent open spaces are usually not thought of till too late. There are conspicuous examples of this all round London.

It is not only for public recreation that, in anticipation of the expansion of a city, the local authorities need to acquire surburban land while it is still far from the built-over area. There are many other public purposes for which they will ultimately need land when the city is more fully developed, *e.g.*, building-sites for schools, hospitals, asylums, offices, halls, markets, police-stations, fire-stations, registry offices, &c.; and open spaces for parking grounds, cemeteries, aerodromes, storeyards, sewage farms, &c. It is also very advantageous to the local authority to have suburban land of their own to offer in exchange for private land which they may find it necessary to acquire in the public interest in the heart of the old town, *e.g.*, land required for improving a narrow or crowded street, slums requiring demolition and reconstruction, or sites occupied by offensive trades or for uses which tend to depreciate surrounding properties.

It will, however, often be very difficult for a local authority, hampered by the proble volved in rapid development of a rural i urban centre, to finance the acquisition c In the earlier stages of development th able value of the town will be low, and therefore be difficult to raise the funds re even for such pressing needs as new roa drainage schemes; and without these t houses, on which the increase of rateable and therefore of borrowing power de will not be built. On the other hand, th of open spaces is not felt at first, becaus is so much open land within easy reach centre—many times more, perhaps, t required by the present population f creation. The local authorities are pr overlook the fact that most of the p private recreation grounds are only temp available as such, and are liable to be priated ultimately for buildings, the erec which will not only decrease the supply also increase the demand for permane creation grounds and so increase thei It is all the more necessary that some s authority like a County Council, with interests and more ample resources tha local authority of the growing town while open land is still cheap, come to t of the latter, either by loans or by grants or otherwise.

To recapitulate: (i) With the gradu pansion of growing towns there accr suburban land a gradual enhancement of in consequence of the changes in the pu for which it is likely to be used—first agric then recreation, then building. (ii) landowners will ordinarily put their la the most paying use without considerat public interests; so private land is seld served permanently for recreation but i temporarily put to recreational use until i demand at an enhanced price for bu (iii) It is, therefore, desirable in the interest that at an early stage i development of towns the local auth should acquire such suburban land a ultimately be needed for public recreatic other public purposes while it has still o agricultural value. (iv) The financial diffi which the local authorities would enc could be largely overcome if the Mid County Council's policy of subsidising Municipal and District Councils' open space schemes by grants of one-fou the cost were adopted by all County Cour

"BOOKWORM."

Laying of Bricks.

TO MR. V. J. WENNING.]

e seen a very similar method to d by Mr. Wenning used in several buildings of a very cheap class, retchers on edge were alternated on edge which, though making ger wall by the through bond, her for probably the same reason. g's method is, however, unsound nds. k on edge, without the keyed joint ost methods of slab work, is ex- and would hardly stand a sharp cavity wall construction, to be weather tight, throws almost the entire weight of the superstructure upon the inner shell. If we take 1½ tons per ft. run as a fair weight on the foundations of the outer walls of an ordinary house, this is equivalent to a load of 6 tons per sq. ft. on the narrow base of the inner shell, and this is outside the safe load of most stock brickwork in lime mortar. (3) The appearance would be bad, and the application of rough cast would about cancel the saving. Facing bricks would have to be specially made for an exposed bed.

Many centuries of practice have evolved the best methods of building brickwork, and the best sizes and shape thereof. The problem of dear brickwork will have to be solved rather by the politician than the constructional inventor.

"TRADITION."

SIR,—In the United States the National Association of Brick Manufacturers has been urging for several years the use of the Ideal Rolok Bond for brick walls. Thousands of dwelling-houses have been thus built all over the country and a number of cities contemplate admitting it under the building ordinances. The city of Los Angeles, California, has permitted it for three years to my knowledge. In this method (which is not patented) the bricks are laid in Flemish bond, but on end instead of flat.

It is a modification of the hollow-wall system. The 9 in. wall has one space, the 13½ in. wall two, the 18 in. wall three, &c. When buildings exceed two stories in height the face is usually of ordinary brick bond backed on the Rolok system.

Strength tests have been quite satisfactory and the advantages of hollow walls, when well built, are known to all architects and builders. The idea was thought to be new when first proposed several years ago, but it is said that a number of men claim it has been in use in Norway and Sweden in isolated places for several generations. The Ideal Rolok Bond effects a saving in brick, mortar and labour.

The offices of the National Association of Brick Manufacturers are in Cleveland, Ohio, U.S.A., and those of your readers who care to address them are certain to receive some interesting literature on the economy, practicability and strength of walls in which bricks are laid on edge instead of flat.

"ENGINEER."

Oak Timbering.

[REPLY TO MR. T. M. COUZENS.]

SIR,—The best treatment for external oak timbering is an unlimited quantity of the best quality English climate liberally applied for an unlimited number of years. The firm that supplies these goods is Nature & Co. If, however, you are impatient, and long for the nice silver-grey effect, this can be obtained with some success by the application of quicklime, mixed into a stiff paste, applied with a brush, left on for a few days, and then rubbed off. If you desire a very dark effect, there is nothing for it but to use a stain, such as Solignum, but pray spare your beautiful oak this indignity, and your Solignum for its legitimate purpose of protecting soft timbers.

"NATURE."

SIR,—The following information is required before a definite formula or method can be given for the requirements of Mr. Couzens. What is old weathered colour? This is rather comprehensive, as it covers anything from silver grey to black. Is it exterior work or interior? Any polish or finish required afterwards?

ERNEST S. RICHARDS.

Artificial Daylight.

With reference to our correspondent's letter ("K. W.") in our issue of last week, Messrs. The Sheringham Daylight Development Co. inform us that the statement "or by the Sheringham daylight system in which the light is either reflected from a specially coloured surface or transmitted through tinted glass," is incorrect. They state there is only one Sheringham system which is covered by world patent rights. In this system the light of the electric lamp is converted to daylight by reflection from the underside of a top shade treated with their special coloured pigments, in correct scientific proportion according to area. Sheringham Daylight, they inform us, is in no way whatever associated with the transmission of light through a glass colour filter.

Pipes.

SIR,—We shall be glad if any of your readers can inform us what kind of pipe for conveying water and cooling same is employed in Eastern countries. We have been told that a pipe which weeps has the effect of keeping the water inside cool and is frequently used. Is this so, and what is the nature of the pipe employed?

SHAW & STABLES.

Distemper and Asphalt.

SIR,—The distemper referred to by your correspondent in his letter of August 29 was evidently not fit for outside use or it would not have washed off. There are some distempers on the market which when mixed with petrifying liquid are quite reliable outside and will not wash off, but in the case mentioned, it would certainly have been much better and cheaper in the end to have used oil paint instead of the distemper.

ARTHUR S. JENNINGS.

London.

THE PAINTER-STAINERS' COMPANY

THERE is much to regret in the fact that modern trade unionism has not developed on the lines of the ancient livery companies of the City of London. These corporate societies were formed in the Middle Ages for the mutual protection of the members of the various trades concerned, and for the purpose of checking the production of inferior work—which was recognised as prejudicial to their true interests. In the course of time, the companies acquired considerable power in the regulation of matters concerning their trades, and especially in regard to apprenticeship, to the conduct of members, the production of good work, and the use of good materials.

The Painter-Stainers became a united body in 1500, though they existed as separate companies, often acting in association, for centuries before that date. The earliest existing reference to the Stainers is in 1268, when we find them involved in a desperate encounter in which several companies took part, and during which many persons were killed and injured. The Painters are introduced to us by a list of ordinances or rules, dated 1283. These are rules made by "the good men of the painting craft" . . . "for the betterment and relief of the same and for the abatement of false works and all manner of guile." Directions follow as to the good quality of the workmanship required on certain specified items and as to other matters relative to the craft, including abstention from work on Sundays and certain other Holy Days, "save under compulsion of the King." Apparently the painters of the latter part of the fifteenth century were not a little distressed by the influx of aliens into London, for in 1488 they petitioned the Mayor to remedy the hardship to their craft occasioned by "the multitude of foreyns repayring daily to the said citee."

The author of this interesting work* traces the history of the Company from its earliest records to the present day, giving copious extracts from ordinances and charters, and the work is illustrated by several photographs. Particularly interesting among the illustrations is the initial letter of a charter granted by Elizabeth in 1581, showing the Queen in Coronation robes.

PRACTICAL DESIGN FOR BUILDING CONSTRUCTION.—VII.

AN ELEMENTARY EXPLANATION OF THE APPLICATION OF THE THEORY OF CONSTRUCTION TO PRACTICAL DESIGN

By EWART S. ANDREWS, B.Sc., M.I.Struct.E., A.M.Inst.C.E.

SECTION II.—FLOORS AND BEAMS (Continued).

Stress-strain Diagrams.—Before we can decide upon the suitability of a material for constructional purposes we must know its elastic properties, and for this purpose tests are made in which the extensions or contractions of specimens are measured with great care by means of magnifying instruments called extensometers, and notes are taken of the extension at each load. By dividing the load by the original area of the specimen we obtain the stress per square inch, and by dividing the extension by the original length we obtain the unit strain which in British units is the strain per inch length. We then make a graph or diagram on squared paper in which the stresses are plotted vertically and the strains are plotted horizontally and the resulting diagram is called a stress-strain diagram. By the study of the stress-strain diagram of any material we can tell at once its strength and certain other qualities to which we will refer later.

Mild Steel.—A mild steel is one possessing only a small amount of carbon, so that it is tough or ductile as opposed to a hard steel, which is stronger but more brittle than mild steel. The ductability of mild steel which is an indication of its ability to resist shocks without fracture is one of its qualities which make it so excellent for structural purposes.

A stress-strain diagram for mild steel complying with the British Engineering Standard Specification for Mild Steel for Structural Purposes is shown in Fig. 11.

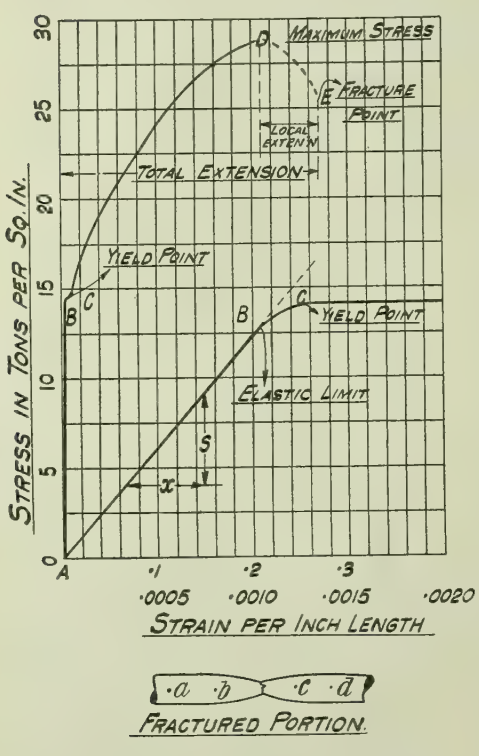

FIG. 11.

For most metals, the stress-strain diagram will be a straight line until a certain point is reached, called the elastic limit, after which the strain increases more quickly than the stress, until a point called the yield point is reached, where there is a sudden comparatively large increase in strain. After the yield point is reached, the metal becomes in a plastic state and the strains go on increasing rapidly until fracture occurs.

The portion AB of the diagram is a straight line, and represents the period over which the material obeys Hooke's law. At the point C the yield point is reached, and the strain then increases to such an extent that the first portion of the diagram is redrawn to a considerably smaller scale. as shown on the left in the figure. The strain then increases in the form shown until the point D is reached, the curve between C and D being approximately parabolic in shape. When the point D is reached, the maximum stress has been reached, and the specimen begins to pull out and thin down at one section, and if the stress is sustained, fracture will then occur. The portion DE, shown dotted, represents increase of strain with apparent diminution of stress. This diminution is only apparent, because the area of the specimen beyond the point rapidly gets smaller, so that load may be decreased and still keep the stress the same. In practice it is very difficult to diminish the load so as to keep pace with the decrease in area, so that this last portion of the curve is very seldom accurate, and has, moreover, little practical importance.

The specimen draws down at the point of fracture in the manner shown in the diagram. Before the test, it is customary to make centre-punch marks at equal distances apart long the length of the specimen. The distance apart of these points after the fracture of the specimen indicates the distribution of the elongation at different points along the length. Four such marks—a, b, c, d—are shown in the figure. The greatest extension occurs at the point of fracture, so that with a specimen of short length, the percentage total extension will be greater than with a longer specimen.

The yield point in mild steel corresponds to a change in the crystalline structure of the steel and is of very great importance; all steel structures should be designed so that the yield point is never exceeded; if the yield point of a beam is exceeded the beam will be visibly deflected, and the deflection will not disappear when the load is removed, the beam being permanently bent. When a steel beam is permanently bent, however, it is not necessarily dangerous and usually has a considerable reserve of strength upon which it can draw until final failure occurs. This is a fact of great importance in considering the safety of mild steel as a constructional material; it does not break suddenly, but gives timely warning by its sagging or deflection. In this connection we ought to explain that the term breaking load applied to a steel beam is an inaccurate term; it is almost impossible to break a mild steel beam. Under test the beam might be so highly stressed that it bent so much that it moved clear of its supports and fell down; but it would not break even if bent nearly into the form of a horse-shoe.

In the mild steel bars used in reinforcing concrete it is a common, and highly desirable practice to bend the ends into the form of a hook, and except for the largest sizes of bars this bending is, and should be done, cold. Now, if you bend the end of a bar to the form of a hook, you must very much exceed the yield point of the material in doing so, but you have not hurt the material if it is good mild steel. That is one practical reason why it is an excellent plan to have all such reinforcing bars bent cold to a hooked form; if the steel is not ductile, but brittle, it will break off—like a carrot, as it is often expressively stated—thus showing that the material is not up to the specification. This means that every bar on the job is put through a very practical test by forming the cold bend upon it.

This we have referred to as o

ing" consists in taking out some
ness, so as to produce a steel that i
and harder than the normalised
relatively ductile; it is usually dc
to a certain temperature, below
or normalising temperature, and
to cool slowly.

STRESS-STRAIN DIAGRAM FOR COMPRESSION.—We will now stud

diagram for a typical brittle as concrete.

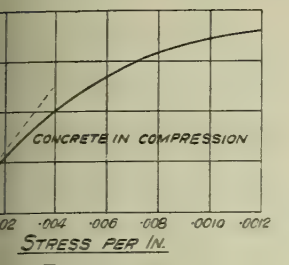

FIG. 12.

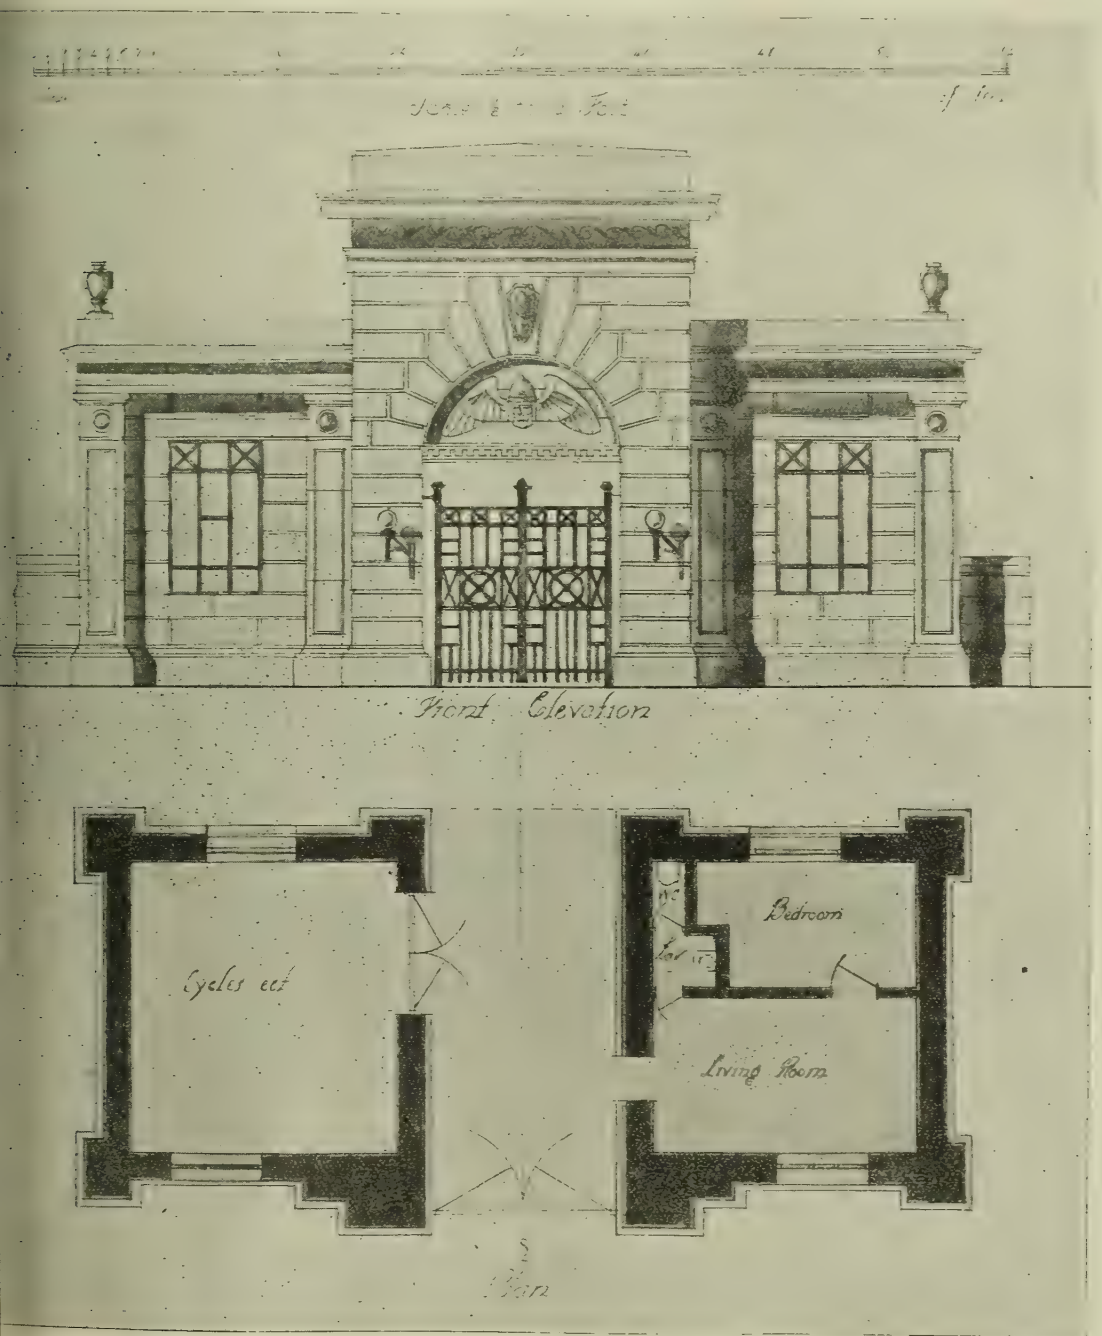
n represented in Fig. 12 is for , 90 days old; by 1–3–6 concrete is meant concrete made of 1 volume of cement, 3 volumes of sand, and 6 volumes of coarse aggregate, such as gravel or broken stone, from ¾ in. diameter down to ¼ in. diameter; the material from ¼ in. diameter downwards being regarded as sand. It will be noted that there is nothing corresponding to the elastic limit or to the yield point in the diagram; nor is there any portion of the diagram for which the stress is strictly proportional to the strain, the diagram curving right from the beginning, so that the strains increase more rapidly than the stresses. The working or safe stress of this quality of concrete would be about 450 lbs. per sq. in., and it will be clear from the description that the error involved in regarding the stress strain diagram as straight up to this point will be very small; this has an important bearing upon the theory upon which the strength of reinforced concrete beams are calculated.

From this diagram it will be seen that when the strain per in. (unital strain) is .0002, the intensity of stress is 600 lbs. per sq. in.



Young's modulus for 1–3–6 concrete:—

$$= E = \frac{600}{.0002} =$$

= 3,000,000 lbs. per sq. in.

This is one-tenth that of steel.

Before leaving this diagram, we will note that the breaking stress of this concrete was 1,800 lbs. per sq. in.; this is 116 tons per sq. ft., and the mixture is not such as we should use for first quality concrete, nor is the test result high for this mixture. Yet the London Steel Frame Act only allows 12 tons per sq. ft. on concrete, no matter how poor the quality is; it is obviously absurd and results in much waste of money in providing much larger base plates for steel stanchions than are necessary.

Design for a Gateway Entrance and Lodge. By MR. J. C. HUGHES.

oduced this design at the age of 16, and had had only seven months' training. He had not attended any university classes.]

THE BUILDING TRADE

THE HOUSING ACT AS PASSED

THE Housing Bill was so hurried through Parliament in its last stages that it was very difficult to follow all the amendments, some of which were promised at previous stages and drafted at the last moment; therefore we propose considering the Act in the final form it has assumed.

Extension of Period in Act of 1923.

Section 1, subsection (1) is as in the Bill. The effect of this subsection is to extend the provisions contained in sections 1 and 3 of the Housing Act, 1923, to houses which are completed before October 1, 1939, instead of October 1, 1925, as provided in that Act. These sections of the Act of 1923 apply to houses provided by local authorities or by public utility societies or other bodies. But by subsection (2) of section 1 of the new Act the following paragraph is substituted for paragraph (*b*) in section 1, subsection (1) of the Act of 1923, which relates to contributions by the Minister, and now reads: "Towards any expenses incurred by the local authority in the provision of such houses" (that is, houses under Part III of the Housing of the Working Classes Act, 1890) "by the local authority themselves," and the subsection goes on to provide, "Where a local authority purchases any such houses as are referred to in the said paragraph for the purposes of Part III of the Housing of the Working Classes Act, 1890, the houses shall not be treated as houses provided by the local authority themselves within the meaning of the said Act of 1923 or this Act if the houses are houses which have been completed before the passing of this Act" (August 7, 1924), "or have been occupied prior to the purchase."

Increased Contributions under New Act.

Section 2 deals with the increased contributions to be granted to local authorities for houses provided by themselves, or to public utility societies, or other bodies under section 3 of the Act of 1923, and with expenses incurred by a local authority in promoting the construction of houses under section 2 of the Act of 1923, or this Act. The first part of the subsection stands as in the Bill, and there is an alteration in the proviso. This proviso now reads: "Provided that where the contributions are made towards expenses incurred by a local authority in promoting the construction of houses in accordance with section 2 of the said Act as amended by this Act, the said Act in its application to any of those houses shall have effect with the following modifications..." Then paragraph (*i*) which relates to the amount of contributions payable under section 1 subsection (1) of the Act of 1923, substituting £9 for £6 and 40 years for 20 years has been amended from what it was in the Bill by inserting the words "or in the case of a house situated in an agricultural parish" and £12 10s. is substituted for £6. In the following paragraph (ii) in the Bill paragraphs (*a*) and (*c*) of section 2, subsection (3) of the Act of 1923 were repealed, but in the new Act as it now stands only paragraph (*c*) ceases to apply, but paragraph (*b*) has been considerably altered from what it was in the Bill. This paragraph now provides that one of the methods in which assistance under this section may be given by the local authority is that they may "undertake to pay such annual sum as may be specified in the proposals for a period not exceeding 40 years to the person for the time being in receipt of the rent payable by a tenant to whom the house is let, or in the case of a house not so let to the person by whom the rates on the house are payable." The latter sentence was not in the Bill, and a further proviso has been added to the subsection: "Provided also that in any case where proposals are submitted to the Minister which, in consequence of the adoption of new materials, or new methods of construction, involve a reduction in the estimated annual expenses to be incurred in connection with each house substantially greater than the equivalent of £4 10s. per annum for forty years, the Minister may reduce the contribution by such amount as he shall think just and reasonable, but nevertheless that the contribution shall not be reduced to such an extent as to leave any part of such estimated annual expenses to be borne by the local rate, or by the said body, trustees, or company, as the case may be."

Subsection (2) of section 2, which relates to the definition of agricultural parishes, has been altered from what it was in the Bill by substituting 25 per cent. of the new annual value to be the lowest proportion of agricultural land instead of one-third, and by stating that the population shall be less than 50 persons per hundred acres. In the Bill the number was 35 persons.

Subsection (4) has been considerably amended and now runs: "Houses provided in pursuance of proposals approved by the Minister before the passing of this Act (August 7, 1924), if the contract for the construction of the houses was entered into, or, in the case of houses constructed otherwise than under contract, the construction was begun after February 1, 1924, may for the purposes of this section (that is, increased contributions) if the Minister so directs, be treated as if the approval had been given after the passing of this Act, notwithstanding that the houses do not comply in every respect with the conditions imposed by or under this Act."

Subsection 5 did not appear in the original Bill; it provides that where in pursuance of proposals approved by the Minister under this Act houses are provided by the Common Council of the City of London, or by a Metropolitan borough council, the London County Council may, in respect to a house subject to special conditions, supplement any contribution made by the Minister to an extent not exceeding £2 5s. annually for a period of 40 years. It is provided that for the purposes of paragraph (*e*) of section 3 subsection (1) "the amount of any such supplemental contribution shall be treated as if it were part of the expenses borne by the local rate in the city or borough," which we understand to mean that they are to be taken into account in fixing the rents of the houses.

As to houses provided by the London County Council see sections 12 and 14 below.

The Special Conditions.

The special conditions mentioned in section 2 of the new Act are set out in section 3. In the Bill the local authorities had to undertake that the conditions would be complied with "in such manner as the Minister might require," but in the Act the undertaking is to be "in accordance with rules made by the Minister and approved by the Treasury."

The conditions are set out in section 3, subsection (1), and the first is: (*a*) That subject to the following conditions (these words were not in the Bill) the houses shall be let by the local authority for occupation by tenants who intend to reside therein.

The first part of condition (*b*) is as in the Bill, that it shall be a term of such letting that the tenant shall not assign, sub-let, or otherwise part with possession of the house without consent in writing, but then follow these words now inserted in the Act: "and that such consent shall not be given unless it is shown that no payment other than rent has been, or is to be, received by the tenant in consideration of the assignment, sub-letting or other transaction."

Condition (*c*) has been slightly redrafted as to the first portion and at the end an addition has been made. It now reads: local authority desire to sell or lettings as aforesaid) otherwise houses, the sale, or disposal, shall except upon, and subject to, suc if any, as the Minister thinks reduction of the amount, or the the duration of any contribution Minister, or for both reduction a (here follows the addition made t so, nevertheless, that the contribu of any house sold before the e period of 20 years, from the d contribution first became paya be reduced by more than £3, or a house in an agricultural parish £6 10s., and the duration there curtailed by more than twenty

Condition (*d*) did not appea exactly in its present form. It i wage clause which complies with of the House of Commons applica of Government departments, an being in force, shall be inserted i for the construction of the house

Condition (*e*) which relates to t charged, except for an addition a "that no fine, premium or other be taken in addition to the rent" in the Bill, but there is a new c the Act that "reasonable prefe given to large families in letting

Subsection (2) of section 3, wh houses provided by a society, bo or company under section 3 of th and to houses the construction o moted by a local authority unde that Act has been redrafted, th ditions being set out in full.

They follow in the main the sp already referred to under subsect condition (*f*) as regards large fa appear under this subsection.

Subsection (3) which relates previous subsections and defines priate normal rent," has been ar insertion of the words "exclusive there is a new provision as to t "Every rule made under this s laid before both Houses of Parliam and if an address is presented t by either House of Parliament w subsequent 28 days on which th sat after any such rule is laid, pr rule may be annulled, it shall void, but without prejudice to anything previously done there making of a new rule."

Termination of Contribu

Section 4 which deals with terminate Government contribu conferred by subsection (1), is the Bill, but alterations have been in Act in subsection (2). The fi paragraph (*a*) which makes a de number of houses completed terminating contributions is the s Bill, but the following extra pas added to the paragraph: "Wh ciency is due to the absence of ade ments for the necessary increase of labour (including any necessary of the number of apprentices em the necessary increase in the supp at reasonable prices, or for the obt at reasonable rates of interest provision of houses, or arises fr cause whatever."

We cannot help pausing here to this subsection is hardly consis so-called guarantee to the buildi

Paragraph (*b*), which deals reason for terminating contri inquiry by a body of indepe appointed by the Ministry, the Mi that the cost of erecting hous

**al Authority to Promote Con-
struction.**

vides that where the Minister
cal authority has failed to take
steps for promoting the con-
uses, either under the Act of
, then the provisions of section
1923 shall "apply to persons
take, or who have undertaken,
of houses in the area of the
n like manner as they apply to the societies, bodies of trustees, and companies therein mentioned, and the provisions of this Act relative to such societies, etc., shall extend to those persons." This is an extension of section 3 of the Act of 1923, apparently to any person willing to construct the houses.

Materials and Methods of Construction.

Section 10 is very important and we give it *in e tenso*. Subsection (1) provides "In approving proposals for the construction of houses under this Act the Minister shall not impose any condition which would prevent the materials required being purchased in the cheapest market at home or abroad or which would require the employment of any particular trade."

Subsection (2) is: "If at any time it is shown to the satisfaction of the Minister that a local authority has without reasonable cause refused to adopt a new material, or method of construction, which in his opinion would reduce the cost of the house without unduly affecting its durability, suitability or appearance, the Minister shall require the adoption of the said new material, or method of construction, to be reconsidered for that purpose by the local authority, and in the event of their failure without reasonable cause to adopt the same shall make such deduction from the amount of the contribution payable by him, as in his opinion is reasonable having regard to the amount of the unnecessary expenditure so incurred by the local authority, but for the purposes of paragraph (*e*) of subsection (1) of section 3 of this Act (that is the rent chargeable) the expenses of the local authority shall be calculated as if no such deduction had been made."

This section appears to call for some comment as it confers very wide powers on the Minister. We live in times like the Athenians of old who were always anxious to hear of any new thing. New methods of construction are being placed before us which require careful testing and proving by the lapse of time. We have had experience of some Ministers in the past who are by nature somewhat impulsive, and this section will place the local authorities entirely in the hands of the Minister, the contribution depending entirely on what may appear to him "reasonable cause" for not adopting new methods.

Suspension of Operations by Local Authorities.

Section 11 may be difficult to interpret in connection with the absolute provisions of the Act. It provides "A local authority in carrying out any proposal approved by the Minister for the purposes of this Act shall have power to determine the number of houses which they will build in any particular period subject to a maximum limit by the Minister, and should the local authority find it necessary to suspend building operations on the ground of excessive cost, or on any other reasonable ground, the suspension shall not be treated as a failure on the part of the local authority to fulfil their obligations as to the preparation of schemes under the Housing Acts, or their obligations under any such schemes."

Here the Minister's jurisdiction seems limited to fixing a maximum, and he appears to have no voice in what may be deemed to be "excessive cost or any other reasonable ground." Local authorities may differ as to what is "excessive cost," and the same sort of deadlock may occur as has sometimes been experienced in connection with town planning. We approve the local authorities being given considerable discretion, and deprecate the overriding powers conferred by some sections on the Minister, but for the general working of the Act it would appear that some independent tribunal should exist to decide on the kind of question dealt with in this section.

Powers of County Councils.

Section 12 confers upon County Councils the same powers as are conferred upon local authorities by section 5 of the Act of 1923 to make advances to persons or bodies of persons for constructing or altering houses, and contains provisions as to the borrowing of money for this purpose.

Section 13 is as clause 7 stood in the Bill, and relates to minor amendments of the Act of 1923 contained in the Second Schedule to this Act.

Section 14 subsection (1) relates to agreements between the London County Council and the Common Council of the City of London or any metropolitan borough council by which the latter may contribute such amounts as may be agreed subject to the provision of this Act towards the provision of houses by the County Council within, or without, the county to meet any special needs of the Common Council, or the borough council, and in such a case for the purposes of paragraph (*e*) of subsection (1) of section 3, relating to rent, the amount of any such contribution shall be treated as if it were part of the expenses borne by the county rate.

Subsection (2) provides that any expenses incurred by the London County Council under this Act, and under section 2 of the Act of 1923, as amended by this Act, shall be defrayed as expenses for general county purposes.

There are some alterations in section 16, which applies the Act to Scotland, which we need not notice here.

The complication of the legislation, we fear, makes it very difficult to explain the matter clearly, but what we have endeavoured to do in this notice is to show the form the Act has taken now it is law, so that its provisions can be followed by our readers.

THE PREVENTION OF EVICTION ACT

THIS Act, which represents the "ridiculus mus" brought forth by the Government when the Bill they originally introduced in connection with the agitation as to evictions, more especially on the Clyde, was defeated owing to its form, is only another Rent Restriction Act which introduces further confusion in the law. We noted the Bill when it passed its third reading in our issue May 16, but it has since been amended in the House of Lords and its provisions should be considered, for they have a material bearing on the Rent Acts.

The legislation is rather confused because the Rent Restriction Act, 1923, in section 4, re-enacted as amended the whole of section 5 of the Rent Act 1920, which deals with "Restriction on right to possession," and therefore section 4 of the Act of 1923 now represents section 5 of the Act of 1920. This explains the wording of the first subsection of section 1 of the Eviction Act, which is as follows:—"Paragraphs (iv) and (v) of sub-section (1) of the section which, by section 4 of the Rent and Mortgage Interest Restrictions Act, 1923, is substituted for section 5 of the Increase of Rent and Mortgage Interest (Restrictions) Act, 1920, are hereby repealed as respects pending, as well as future, proceedings, and the following paragraph shall be substituted therefore." Before setting out this paragraph which takes the place of paragraphs (iv) and (v) it should be noted that they occurred, and the new paragraph occurs, in that part of section 4 of the Act of 1923, or 5 of the Act of 1920, which deals with a relaxation of conditions laid down in paragraph (d) earlier in the sections. The paragraphs in question are headed by the statement "The existence of alternative accommodation shall not be a condition of an order or judgment on any of the grounds specified in paragraph (d) of this subsection" and then follow five paragraphs beginning with the word 'where' and the new paragraph substituted for paragraphs (iv) and (v) is as follows: "Where the dwelling house is reasonably required by the landlord (not being a landlord who has become a landlord by purchasing the dwelling-house or any interest therein after May 5, 1924) for occupation as a residence for himself, or for any son or daughter of his over 18 years of age, and the Court is satisfied having regard to all the circumstances of the case, including any alternative accommodation available for the landlord, or the tenant, that greater hardship would be caused by refusing to grant an order or judgment for possession than by granting it."

The sons and daughters were restored to the Act in the House of Lords. In the first place, it

is necessary to see in what respect this new paragraph alters the two paragraphs it is substituted for. Paragraph (iv) applied to the landlord or the husband or wife of the landlord requiring the house reasonably for occupation for himself or for any sons and daughters over 18, but where the house had been acquired by the landlord or husband or wife of the landlord before June 30, 1922, stated no condition. Paragraph (v) dealt with the same persons, but provided that where the house had not been acquired before that date then the Court must be satisfied that greater hardship would be caused by refusing to grant an order or judgment than by granting it.

The new paragraph repeals both these paragraphs and applies only to a landlord who has become landlord before May 5, 1924, and thus in all other cases the landlord requiring possession is thrown back on paragraph (d) with the much more stringent provisions as to alternative accommodation, for the Court has to be satisfied that "alternative accommodation is available which is reasonably suitable to the means of the tenant and to the needs of the tenant and his family, as regards extent, character, and proximity to place of work, and which consists either of a dwelling-house to which the Act of 1920 applies, or of premises to be let as a separate dwelling on terms which will afford to the tenant security of tenure reasonably equivalent to the security afforded by that Act in the case of a dwelling-house to which that Act applies." Section 2 sub-section (1) of The Prevention of Eviction Act has a side note, "Application of Act to pending proceedings," but this seems misleading as the sub-section, as will be seen, enables proceedings which are completed, save as to execution, to be re-opened. The sub-section is as follows: "Where any order or judgment has been made or given before the passing of this Act but not executed, and in the opinion of the Court the order or judgment would not have been made, or given, if this Act had been in force at the time when such order or judgment was made or given, the Court on application of the tenant may rescind or vary the order or judgment in such manner and subject to such conditions as the Court shall think fit for the purpose of giving effect to this Act."

The next sub-section (2) we find extremely difficult to explain, it provides "Where a landlord has on or after April 15, 1924, taken possession of a dwelling-house under a judgment, or order so rescinded as aforesaid, such possession shall not in any case exclude the dwelling-house from the operation of the Rent and Mortgage Interest (Restriction) Acts 1920 to 1923."

The sub-section is obviously directed to section 2 Sub-section (1) of the Act of 1923, which takes houses out of the Restriction Acts when the landlord comes into possession at any time after the passing of that Act (July 31, 1923), but it is difficult to see how a landlord could take possession under an order or judgment not executed, for it is only judgments and orders not executed which can be "so rescinded as aforesaid," and also whether the sub-section applies to an order varied under sub-section (1). Whatever the meaning of this section may be, it appears that although no time limit is imposed under sub-section (1), and thus any unexecuted order or judgment can be dealt with, so far as losing the benefit of the Act of 1923 is concerned a time limit is given, and a landlord coming into possession before April 15, whether under an order or judgment subject to sub-section (1) or not, takes his house free from Rent Restriction. The section is so curiously drafted that questions as to its interpretation are certain to be raised in the courts.

By section 3 of this Act The Prevention of Restriction Act is to be construed as one with the Rent and Mortgage Interest (Restrictions) Acts, 1920, and 1923, and those Acts and this Act may be cited together as the Rent and Mortgage Interest (Restrictions) Acts 1920 to 1924. This curious nomenclature is a pitfall for the practitioner in the future, who may well overlook this Act in considering the Rent Restriction Acts, and it can only have been esorted to in order to connect this Act with the Bill which did not pass relating to evictions.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Aberdeen.—HOUSES.—The Plans Committee has passed plans for a villa in Queen's-road, estimated to cost £1,200, and a bungalow in Buros-road, to cost £800.

Dundee.—HOUSES.—The Works Committee has passed plans for property to be erected in the Murraygate, for Messrs. Woolworth.

Greenock.—BUNGALOWS—The Dean of Guild Court has passed plans for three bungalows at Inverkip-road.

Elderslie.—BUNGALOW.—The Buildings Committee of the Renfrewshire District Committee has passed plans for a bungalow at Glenpatrick-road, Elderslie, for Mr. R. Snodgrass.

Renfrew.—HOUSES.—The Board of Health has approved of the lay-out and plans for 60 houses to be built at Moorpark.

Kirkintilloch.—HOUSES.—The Dean of Guild Court has passed plans for the first instalment of the new housing scheme. The plans provide for five tenements of four houses each, eight of the houses being of two apartments and twelve of three apartments, with scullery and bathroom. The site is in Eastside and Kilsyth-road, and a new road is being formed connecting Kilsyth-road and Eastside.

Portsoy.—HOSPITAL EXTENSION.—The Campbell Hospital Board at Portsoy has decided to proceed with the extension of the hospital. The cost is estimated at £1,600.

Falkirk.—SCHOOL AND MILL.—The Property Committee of Stirlingshire Education Authority has made inquiries with regard to a site in Falkirk for a technical school.—The Dean of Guild Court has passed plans for a new grinding mill at the west side of Falkirk Foundry, Grahamston, for the Falkirk Iron Co. The cost is estimated at £3,500.

Glasgow.—VARIOUS.—The Dean of Guild Court has passed the following plans: The Glasgow Corporation, public baths and wash-houses, in Dobbie's Loan, at Wood-street, at an estimated cost of £21,627; shops and houses, at 3, Ell-road, Crosslee-street, Paisley-road, and Barlogan-avenue, at an estimated cost of £47,302; the Governors of the Victoria Infirmary, pavilion, operating theatres, &c., at hospital at Langside-road, at an estimated cost of £49,601; James Templeton & Co., carpet manufacturers, Greenhead, welfare block at factory, at an estimated cost of £14,355; James Bennie & Sons, Ltd., engineers, Govan, reconstruction of engineering works at Drumoyne-road; Smith (Glasgow), Ltd., alterations to Grosvenor Restaurant, Gordon-street; Adam Gibson, house and offices, at Helensburgh-drive, Jordanhill; and Dr. W. S. Aitken, house at junction of Tinto-road, and Kilmarnock-road, Newlands.

Perth.—HOUSES.—The T.C. has decided to borrow £30,500 for the erection of houses at Dunkeld-road, and the purchase of houses at Thimblerow to be demolished in connection with the improvement of insanitary areas.

CONTRACTS OPEN.

NO DATE.—**Rutherglen.**—PAVILION, &C.—Bowling green and pavilion at Farme, Rutherglen, for Miners' Welfare scheme, for which tenders will be issued shortly. Applications to be sent to Messrs. J. H. Allen & Sons, surveyors, 224, St. Vincent-street, Glasgow.

HOUSING

Progress in Scotland.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to July 31, 1924:—

	Completed	Under Construction.
1919 Act	22,480	2,830
Private subsidy scheme	2,324	—
Slum clearance schemes	507	1,640
1923 Act	487	4,113
	25,798	8,583

Of the total number of houses completed and under construction under the 1923 Act, 1,689 are by the local authorities and 2,911 by private enterprise.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Masons' Bricklayers' Plasterers' Labourers.

NEW INVENTION

A New Tap.

In view of the Water Board's dictum concerning the use of economical water-taps, particular interest attaches to the "Thompson" patent water-saving tap, which was invented before the war, and is only now being put on the market. This bib-cock tap is composed of only three metal parts, with a special fibre washer and keep. Its construction is simple, and it is claimed to be drip-proof and fool-proof. The action is such that the water is cut off gradually, thus avoiding "hammering." A half-turn of the handle gives a full flow. Specimens may be seen at Captain Thompson's agents, Messrs. James Blackford & Sons, of 90, Cannon-street, London, E.C.4.

THE "THOMPSON" TAP.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

I.—No. 4258. SEPTEMBER 12, 1924.

ADVERTISEMENT AND PROPAGANDA

THE architect does not advertise. This is a bald statement, but true. It implies much that is brave and dignified, but a danger lies in the righteousness of the Sadducee; he, anyhow, is not like the Pharisee—or one or two other architects—and he beats his In all professions, not only in architecture, if we are we must admit that there is a great deal of insincerity d behind noble sentiments, and that, if we are going to ge the spirit that rightly opposes personal glorification, t first free ourselves from cant. No central body and lation of rules as to etiquette can prevent the born ertiser from having his fling. The more rules and nces are framed, the more isolated and supreme his The booster has got to be accepted, but because we im so much let us not make the mistake of forestalling criticism on ourselves by beating our breasts too hard; he architect must not advertise, architecture needs all paganda it can get. There is a vast difference between ement and propaganda, and unless we boldly recognise nction, and encourage our authorities to speak out and p, a great opportunity will be wasted.

a curious paradox that, while architecture is increasingly l in the cultivated world, the architect has never been loyed. If all the qualified architects were to announce l strike, nobody, including the cultivated world, would air. "After all," even the latter would remark of a illusion, "Christopher Wren was not a qualified ." How then can the profession make good? Some- as got to show that it is indispensable. It is true that alues are being recognised, but it is also true that at of stringency cheapness has become a religion, and un- architect can convince people that his employment ite economy, builder, local authority, factory owner, l private client are not going to use him as he should At the moment it is idle to pretend that the majority possible patrons believe that it pays to get qualified the larger private client hardly exists, and with the of a few prosperous firms and public bodies there are who are prepared to pay for what is deemed to be a." This is an age of cheap literature and a generous in science and discovery. Architects must not be to go into the market-place and make people interested, e architects themselves, but in their wares. Archæ- historical architecture play a valuable rôle in culture, rbed as a hobby, they tend to defeat an interest work by placing architecture among the believed lost encouraging an affectation in the antique. The young women of to-day are the public of to-morrow, and d a splendid field for architectural propaganda. They ly read rubbish, as anyone familiar with bookstall can prove. A few might glance at a well-illustrated scribing a manor house and its history in Shropshire, ndred would respond to a vigorous article, such as e our Suburbs Awful?" "Wembley and its Ferro- " "Shadows in Building," "The Complexion of Brick While it might be argued that none of these points that employing an architect is an economy, they must niliarise ordinary people with the everyday significance ture, and to make them realise the nature of the erec- hich they themselves live. Only thus can the way be or the future and for the creation of an appetite for gs.

ld be unfortunate if those architectural writers who l to the layman were discouraged, either by feeling people had been doing the same thing—for in this market the workers do not detract from each other, they only create a further demand—or, which is a more serious danger, by the suspicion that such publicity is regarded as personal advertisement. We all know that publicity may become an agent for personal advertisement, and we have agreed that the booster will use any means to exploit himself, but a signed popular article, for example, is no more advertisement than a book, or a drawing of a building in the Academy or in the Press. To advertise, in its strict sense, is to pay for publicity. To write on an architectural subject is as much a normal professional activity as to give an opinion on the re-decoration of a house. It would again be absurd if an article should escape stigma because it is written for an exclusive section of the Press, while one that is definitely directed to a wider public should run the risk of being frowned upon as vulgar, if not definitely unprofessional. Such self-conscious nervousness will not keep the calling unspotted, but it will encourage hypocrisy. Architecture needs its reformers and its propaganda, and those who are sincere must not be scared away. The public need to be informed and instructed if the art is to be advanced in public estimation, and who is better able to perform this service than the architect himself? His executed work as an architect, moreover, while it should have an educational value to the public who may see it, cannot make such a widespread appeal as it does when published. The profession as a whole has now more opportunities for social meetings and corporate activities than it had in the more individualistic past, and we may be sure that the opinion of their fellows will be the most wholesome corrective to those tempted to uplift themselves rather than to serve their calling.

The intention of professional etiquette is that the profession should stand high in the public estimation, and architects cannot too scrupulously avoid interfering, by means of etiquette or otherwise, with the freedom of the client. Any interference with the client's selection of an adviser smacks so strongly of the less desirable traits of trade unionism that it only serves to irritate the public with the profession generally. To take a practical example. If a man builds a house to Smith's design and then wishes to add to it but does not like Smith, or has no confidence in him, ought another architect, Brown, to refuse the commission? If he does, the one certainty is that the client will not be bullied into employing Smith. He will do the obvious thing and avoid architects altogether. A profession should rely less upon rigid rules of etiquette than upon a high sense of honour among its members. The strictest rules can be evaded by those who are prepared to behave dishonourably, but a conscientious sense of honour cannot be evaded.

A measure of professional etiquette, conducted on the right lines, is not only desirable but essential. But as we have seen, it contains the germs of red-tape—creatures that must be kept strictly under control. In one of his earlier books Sir Arthur Conan Doyle introduced an irresponsible but brilliant young doctor in partnership with a prosaic individual. When the prosaic man remonstrated with some of the actions of his wild friend, the other would observe that professional etiquette was devised with the sole object of keeping the work in the hands of the older men, and he would add that when *he* became a well-established elderly gentleman with an assured practice he would be the pillar of etiquette in its strictest form. The author, no doubt, did not intend the sentiments of his characters to be taken too literally, but the wild man's complaint was not sheer nonsense, and in these days of unification it may hold a message for us.

NOTES.

New Methods of Building.

No time has been lost by the Ministry of Health in taking action on its promise to inquire into the possibility of using alternative and new methods of construction in carrying out its housing programme, and a Committee (see p. 412) has now been set up to report on the subject. While it covers many interests, we would have liked to have seen on this Committee a representative or two of those architects and builders whose chief business is the erection of the smaller type of house at the lowest possible cost, for while the systems used on large housing schemes are generally known there must be many methods of building in materials other than brick which have been carefully worked out and used for the erection of one or two cottages that could be successfully applied to larger schemes. No doubt, however, the Committee will investigate the methods practised by the smaller builder, and it is also to be hoped that inquiries will be made as to what is being done abroad. Attention will no doubt be concentrated on concrete as the alternative material most in use, but it cannot be said that concrete blocks, involving the employment of the bricklayer, are the last word in concrete cottage construction. Poured concrete is extensively used in America for house construction, and in Holland a porous concrete is being used which is claimed to be cheaper and more satisfactory than the dense concrete, or combination of gravel concrete and breeze concrete, generally used here.

Labour and Housing.

We note that the Committee includes two representatives of the building trade operatives. This is as it should be, for it is essential that any new departure should have the support and hearty co-operation of all concerned, but it is to be hoped obstacles will not be put in the way of the introduction of new methods or new materials on account of the effect they may have on labour already in the industry. Only last month the Merthyr Town Council received a request from the local operatives to stop building concrete houses, because that method did not provide employment for bricklayers, while Mr. Curtis Green, A.R.A., recently gave an instance of a case where the insistence of the trade unions on employing bricklayers for laying concrete blocks had unnecessarily driven up the cost, and continued: "Good houses can be economically built of concrete blocks provided the unions agree to the employment of semi-skilled labour." Whatever new material may be recommended for building the houses there will be enough employment and to spare for a considerably larger body of men than those already in the industry, apart from the agreement between the Government and the industry guaranteeing a fifteen-year programme.

Northfield Church.

Doorway, Northfield Church.

London Traffic and the River.

Of the many proposals for relieving London's traffic congestion, the suggestion for a road bridge along the middle of the Thames from London Bridge to Westminster Bridge can hardly be thought to be the best. It is probable the idea would be ruled out on the ground of cost alone, for although there would be no expensive land purchases involved an enormous number of piers would be required to carry such a road, and in addition to the roadway itself there would be the added cost of steel or reinforced concrete girders spanning from pier to pier and parapet walls. And what of the river traffic? Surely it would be necessary to compensate wharf owners above London Bridge if it were no longer possible for anything but barges to ap their premises, to say nothing of and electricity works above West who now unload coal direct fro which voyage between their wor the coaling ports. From the point of view the result would b trous. The magnificent vistas fr present bridges would be utterly des and at a time when some effort i made to preserve the beauties river by a few men of sound practi artistic taste with an eye to the of the future.

An Alternative.

Many other points o one in considering proposal. For insta already have in the Embankment a broad thoroughfa used to its fullest capacity, runni by side with the suggested new th fare for half its length. And woul use such a road if it were ava Owing to the curvature of the ri tween London Bridge and West the distance as the crow flies acros London from London Bridge to minster Bridge is very considera than would be the case of a road fo the river, and a great deal of passing from east to west already the river at Tower or London travels *via* Southwark-street, St street, and York-road, and cros river again at Westminster. It be found cheaper to construct direct thoroughfare from the south Tower Bridge to the south end o minster, passing through propert is not of great value at present, a not only providing a route whic attract traffic because it was the s but also open up a large area London which now includes a cons amount of slum property.

of
and
ent.

THIS week representatives of the British and American Portland cement industries are celebrating the centenary of the invention of d cement, in 1824, by William to whose memory a tablet was last Friday in Leeds, his native It is not generally known, howhat the material invented by was what we now know as ground ic lime, which he called "Portland" because of its resemblance in o Portland stone. But it was who commenced the process of ment which in the course of a years has resulted in the Portland of to-day. In view of the highly methods of producing presentland cement, it is interesting to at in his original patent speciAspdin specified the use of scrapings accumulated in the rhood of lime kilns," and that nearly forty years after Aspdin's he strength of Portland cement days was only 198 lb. per sq. dern British Portland cement strength of 750 lb. in the same This year will probably also issue of a further revision of the tandard Specification for Portland n order to bring it into line with eased strength of present-day ompared with that manufactured when the Specification was last revised; it is anticipated that by increasing the strengths specified users of cement will be able to make considerable economies.

Interior of Burford Church.

Relief for Strikers.

THE Southwark Borough Council has felt the recent building strike seriously. Its institution was being altered when the strike commenced, and the Board of Guardians estimates the cost of housing the inmates elsewhere at £4,000. Further, the extra halfpenny an hour added to the building wages in accordance with the settlement of the dispute will increase the cost of the work by £500. The Clerk to the Board of Guardians states, however, that the total cost will be £5,050, the extra £550 representing relief distributed to the men on strike. We live in curious times when we make it possible for a body of men to cause us to lose large sums of money and at the same time help them for as long as they choose to hurt us. Southwark cannot complain of the expense it has been put to, but surely this granting of poor law relief to people on strike can hardly be conducive to a speedy settlement of industrial disputes.

The Value of Colour.

AT a roadside station the other day we heard a lady say to her friend, "What do you think of the colour scheme?" The question revealed the fact that people do take some interest in their surroundings, and in this particular case there was also indicated by the ironical emphasis of the question a sense of the incompetency of those responsible for this railway station colour scheme of raw cold green, dingy chocolate and stone colour. A vision of the fine effect of a whitewashed London was once indicated by Professor Lethaby—how big and fine it would look few of us realise—but it really is to be regretted that the value of colour on our health and well-being is not realised and acted upon. Good colour costs no more than bad, and even if our railway stations and public houses were reasonably well treated in colour life would be a more cheerful affair. It is the pervading dulness or vulgarity of our colour surroundings, in the common objects of our everyday life, which call so much for improvement, and the ease with which it might come about with the advice of so many available competent guides is clear enough to be seen.

A Scaffolding Collapse.

WHILE we shall not know the cause of the scaffolding collapse in which two men lost their lives at Westminster last week until after the adjourned inquest, it does bring home the rareness of such occurrences. At a time when so many City and West-End buildings are being put up, in most cases with speed of erection an important object, the industry is to be congratulated on the freedom from accidents which has been experienced during the past few years.

GENERAL NEWS

Professional Announcement.

Mr. P. Oakes, architect and surveyor, has opened an office at 11, Terrace-road, Buxton.

Obituary.

The death took place recently of Mr. William Claessen, of Ceylon, architect. Born in Colombo, Mr. Claessen was articled to Mr. Edward Skinner, F.R.I.B.A., and was responsible for many important buildings in Colombo. He was a Fellow of the Society of Architects, a Member of the Institute of Structural Engineers, and a Council Member of the Ceylon Society of Arts.

The death occurred recently at his residence, in Myddleton-street, Carlisle, of Mr. Richard Nelson, aged 81, sculptor.

Building in South Africa.

H.M. Senior Trade Commissioner at Johannesburg has forwarded particulars of proposed public works schemes. The Municipal Council of Johannesburg, it is suggested, should commit itself to an immediate outlay of £1,340,000 on public works, to be allocated as follows: £500,000 on a new power station, £350,000 on a new gas plant, £250,000 on roads and sewerage, £120,000 on a new free library, and museum, £100,000 on the lowering of railway lines, and £20,000 on the layout of the western end of the Town Hall. Pietersburg municipality has decided to raise a loan of £55,000 to build a new Town Hall and for other reproductive work.

The Housing Act, 1924.

We have received from Messrs. Eyre & Spottiswoode, Ltd., a copy of a pamphlet entitled "An Explanation of the Housing (Financial Provisions) Act, 1924," by Mr. E. E. G. Williams, Barrister-at-Law. Copies can be obtained direct from the publishers, post free, 7d.

War Memorial, Largs.

In St. Columba's Parish Church, Largs, a memorial window and tablet were recently unveiled in honour of the men of the parish who fell in the war. The memorial consists of a stained glass window in the south transept and a bronze tablet affixed to the square stone pillar of the south transept arch. The window is by Mr. Douglas Strachan, LL.D., Hon. R.S.A. The tablet was designed by Sir Robert Lorimer, A.R.A., R.S.A., and executed by Mr. Charles Henshaw.

Central School of Arts and Crafts.

The Syllabus of the L.C.C. Central School of Arts and Crafts, Southampton-row, W.C.1, for the session 1924–5, has just been issued. Particulars are given of courses in architecture and buildings crafts, silversmith's work, stained glass and mosaic, painted and sculptured architectural decoration, book production, furniture, dress design, and engraving,

Instruction on Building Materials.

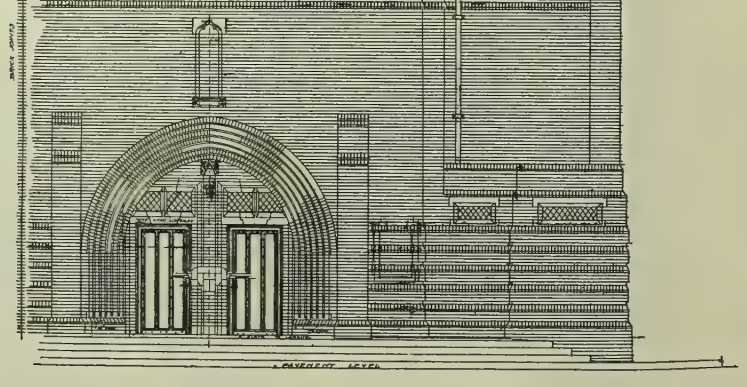
A series of lectures dealing with various building materials has been arranged by the Builders' Merchants' Alliance, to be given at the offices of the Alliance, Finsbury-court, E.C.2. Full syllabus may be obtained from the Secretary.

COMPETITION NEWS

Methodist Church.

Designs are invited for a Methodist Church, school house and manse, Sheffield. Particulars from Mr. T. A. Hardy, 24, Thornsett-road, Sheffield. (See our issue for September 5.)

Manchester Art Gallery.



Designs for an art gallery for the Manchester Corporation. (See our issue for August 22.)

Masonic Memorial.

The sending-in day for this competition is May 1, 1925.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Ross-Smith Memorial (Sept. 30; Feb. 22). Public Baths, Newton-in-Makerfield (Sept. 30; July 11). London Hotel, banned by R.I.B.A. (Sept. 24; August 22). Harrogate Infirmary (Sept. 30; Aug. 29).

New Catholic Church at Northfleet: Portion of North-East Elevation of Tower.
SIR G. GILBERT SCOTT, R.A., Architect.

PARISH CHURCH, NOR FIELD, BIRMINGHA

THE Parish Church of Northfield is situated amidst elms and yews hundreds old, and makes a pretty picture on comi this ancient village. From the outsi tower is, of course, the dominating Built four-square, with buttresses on ea and of three "stories," it has a flat ro embattled parapets and an early G weather vane (so called) on an octagon standing some 22 ft. above. This tower i to be repaired preparatory to re-hangi bells. Originally there were five bells, 1730 they were re-cast by one Joseph Sn Edgbaston, and converted into six. The now again been re-cast and another bell i added. The history of Northfield goes b Saxon times. Then known as Nordfe Manor was before the Conquest held by A The records of Northfield in Domesday m a priest. It is practically certain, th that there was a church (probably a wood here during the time of the Saxon, Alwol

The earliest stonework is of Norman d which there remains notably the doorway north aisle, which is a good specimen of v the period. This doorway was removed the north wall of the nave, when the nort was added by G. F. Bodley about 30 yea

The chancel is a very good specimen o English work, with inside arcades alo north and south walls. The De Somery no doubt responsible for this work, a records show that the old leaded light tained their arms. Unfortunately none old glass appears to have been preserved. nave, south aisle, and south porch are later and in the Decorated style, the portion of the tower being added later st in the Perpendicular style. The porch ca notice in that it is in oak, a method of bu porches which was sometimes adopted that period.

Values of material things appear to undergone some serious changes in Nort as elsewhere. In 1291 an inquisition value of the Manor was taken before Ad Teshall, John de Middleton, and others. list appears: "a capital messuage wort [this was the manor house whose bu covered half an acre of ground and wa rounded with a moat and later by courtesy a castle]; 172 acres of arable land worth p 6d. yearly; two mills one worth £3 6s. 8 the other 20s., &c." By a rental made S ber 26th, 1549, the Manor was rat "£103 6s. 2½d., with 2 shillings for a po pepper, and two red roses."

The church contains one of the windows, about the purpose of which sc has been said and written. It is at preser in and has been so for many years, but traced on the outside. The restoration tower, under an order of the chancellor, about to be carried out before the bells re-hung. It is proposed to remove damaged stonework, to open up, rebo grout in all fissures and cracks due to sett and weather action. The worked stone belfry louvre openings, which are double face (three in the Decorated style and the Perpendicular style) will probably l be removed for the necessary repairs effected as so much of the stonework is d or missing. The oak beams and fram carry the bells will also require much att

The work has been entrusted to Mr. W Caple, F.R.I.B.A., of Birmingham, who us that the work will be started as arrangements are completed with th tractors.

Architect's Estate.

MR. HERBERT BAKER, A.R.A., Architect. (*See p.* 394.)

CORRESPONDENCE

Skyscraper Church.

SIR,—Your editorial in the September 5 issue of *The Builder* on the proposed skyscraper church in New York interested me. I am a visitor from the United States and might add something to your comments. You were struck by an apparent absence of provision for Sunday school activities. The church in question is one which would, in Great Britain, be termed Non-conformist. The Sunday school, therefore, would quite likely hold sessions in the church auditorium, or perhaps in the room provided with stage and cinema.

The placing of a church in a skyscraper building solves the problem of the city church, which, while needed in a district less residential than business in character, because of the encroachment of business, cannot be continued by the sparse number of residents. A skyscraper can be financed with the ground-floor leased for retail business, and all floors above those required for the church and its activities leased for office purposes, or for use as a family hotel. The income will support the church and give it a good opportunity to do useful work, while relieving the officials from the disagreeable necessity of making appeals frequently for financial aid. It is, in fact, an endowed church.

Churches in the United States receive no state aid, all being supported by, more or less, voluntary contributions. A church in the heart of the business district, deriving a great portion of its support from offices and stores in the same building, has existed for many years in Chicago, I understand it has been enlarged recently, or, rather, a new and very much larger building has replaced the old one. A similar building exists in Syracuse, New York, being a combination of church, hotel, &c. A number of others have been planned and the question of financing is now being studied, one being a project to house an Episcopal Cathedral in Chicago. The basement of the building in New York, which was the subject of your editorial, will in no wise resemble a crypt. Space is too valuable. The presence of swimming tanks several stories above street level is not uncommon in the United States, the weight being so distributed by columns that very little rentable space is lost.

E. MCCULLOUGH.

Hopes and Fears for Architecture.

SIR,—The letter of "Isis" in your issue for August 22 exemplifies once more an attitude curiously common nowadays in communications to the press concerning current architecture. The criticism I have in view usually takes the form of deprecating the present-day use of mediæval or allied modes on account of the difference in modern modes of life. Now, without entering upon the merits of this contention, what I want to emphasise is a peculiarity common to most such expressions of opinion, namely, the strangely partial and one-sided application of the principle involved. While frankly adverse to the revival of the older native styles, they yet extend the approval of silence to the far greater anachronisms patent in the use of borrowed ones. The prototypes of our neo-classic edifices are, of course, not only more remote in point of time, but are also notoriously alien in their racial, religious and climatic origins. Moreover, these buildings offend not only by their greater incongruity, but at the same time by their greater numbers. Why, then, have our sensitive critics no word of condemnation for them? What is one to think of the sincerity and consistency of those who thus strain at the gnat while swallowing the camel?

To take the case of decoration, one must presume that these advocates of "Zeitgeist" in architecture would ban, for instance, the "Rose-en-Soleil" of a Plantagenet monarch, while condoning, to say the least, the winged sun-disc of Egypt—now almost a cliche of the latest design. Indeed, a building displaying the one will probably be ignored or attacked; that exhibiting the other will doubtless be eligible for the annual honours of the Institute. Surely the professional pose needs some explaining.

Meanwhile, a perverse public, unmoved, or repelled, by "Monumentalism" (convenient word!) insists on being drawn to traditional types—as evidenced, it may be recalled, among the friends and families of the working men engaged upon the "Liberty" Building itself, on its completion. W. RANDOLPH.

Professional Representation.

SIR,—I have been very cheered to see that in your issue for August 8 you say of housing: "but we have yet to see what a committee of non-party professional and business men of experience would submit upon the general principles underlying the idea of better housing." Whilst fearing that your view will not be popular at a time when, in particular with regard to housing, ignorance of the subject seems to be a sufficient qualification for speaking or writing with authority, yet it is encouraging to feel that you do not propose to allow the betrayal of the professional man to proceed unchecked.

So long ago as November 17, 1922, you wrote upon the subject of "The Outlook for the Architect," and therein stated there was "a lack of appreciation of an architect's services." In a subsequent issue (December 1, 1922), a correspondent, "Student," agreed with you in this, and asked, "But why is this?" He went further, and suggested as the answer "Because he is generally looked upon as an artist only and almost entirely unpractical." Quite so, but I would reiterate, "Why is this?" Are all architects artists? Are we to believe that in a section of the community numbering several thousands there are no energetic practically-minded business men? The assumption would be ridiculous. Why then have not the claims of the professional man been forcibly urged by these energetic practical men to be consulted upon those subjects upon which he has specialised? Has the way been blocked by the unpractical and artistic? Have the constitution and customs of representative bodies prohibited the practical man from coming to the fore?

Old-world platitudes about the education of the architect, at a time when the practically-minded have almost ceased to wonder if there is even an outlook for the architect at all, is not cheerful. H. BRYANT NEWBOLD.

Dalton-in-Furness War Memorial.
MAJOR C. OAKLEY, Architect.

BRIDGETON PUBL HALLS COMPETIT GLASGOW

THE notable enterprise shown by th body of Glasgow in making provision citizens is well illustrated by the recent p to erect halls suitable for general purpose district of Bridgeton, at a total cost of £ with accommodation in two halls for 9 350 sittings respectively.

The invitation to submit designs in c tion met with a gratifying response, nine schemes in all being received from archi all parts of the country. The assessor James Lochhead, F.R.I.B.A., and prem the value of £150, £100, £75, and £50, respe were awarded to the four leading compe

The author of the first premiated d illustrated in our last issue—Mr. C. Voysey, submits an excellent set of dr illustrating the dignified character of his This very appropriate dignity is achieve architectural treatment of a restrain simple character, adequately expressi purpose of the building, while having th of being comparatively inexpensive.

Two halls are provided, with their ma parallel. An admirably-placed buffet is sible from both halls, between which serves as a connecting link. An int point is the provision of an open cour affords light to the buffet and is inter serve as a lounge for smoking, &c. accommodation is well situated on a ground floor, while service lifts connect upper service room, which adjoins bot and buffet.

Top lighting is provided in both hal additional windows of the clerestory typ designer proposes to use the latter in c acting down draught by means of a s placed heating apparatus, which is to be low-pressure hot-water type throughc building. Extract ducts with electrically fans will provide efficient ventilation.

The construction generally is to be o resisting nature, the walls being of bri with steel stanchions carrying steel roof over the two halls. The gallery will ha frame cantilevers with ferro-concrete tre risers. All floors and flat roofs are t ferro-concrete or hollow tile, with the st of ferro-concrete. Hardwood dancing f battens and counter-battens will be pro the halls. Asphalt is to be used on the fl slates on the pitched roofs. The externa will be as recommended in the co namely, of brick or terra-cotta brick, wi dressings. Mention is made, in the report, of special "acoustic plaster" a dados to assist the acoustic tone in t Rather inadequate, and not too situated, the cloakroom accommod perhaps the weakest point in an other fully arranged design, the total probs of which has been estimated at £25,30

The design placed second is by M McNaughton & Son, and John Arth Bath-street, Glasgow, whose plan many points of similarity to that awar place, but the elevations are not so suc

The third premium is awarded to M Alison, 27, Kirk Wynd, Kirkcaldy, for which differs from the majority in principal façade is placed in Summer-s arrangement which, at first sight, woul rather better, affording as it does thoroughfare in dealing with the ass departure of a large audience. The cost of this design most nearly appro amount set forth in the conditions.

A well-balanced elevation is a featu fourth premiated design, the authors are Messrs. Harrison & Ash, 22, Ellis Newcastle-on-Tyne.

Other designs worthy of note include 26, 95, 35, 14, 50, and 65. In a large of cases there was a tendency amongst petitors to understate the probable co designs, and this fact no doubt ruled a few otherwise excellent schemes.

COVERY OF A XIVTH-CENTURY ROOF

By HERBERT SKYRME, M.S.A.

rrying out certain alterations and addi- what was thought to be an old farm some interesting discoveries have been at Wellbrook Manor House, Peter- Herefordshire. The plans show d house in the condition it was before alterations. The ground hows the sitting-room immediately he portion of the old roof above. This as divided off from the hall by a partition; there was nothing on this denote any connection with the fine f above; a modern grate had been n the old opening covering up all traces d fireplace that was afterwards found. upper floor was also divided by a lath and plaster partition which a granary on the one side and a bed- the other. Certain portions of the f were visible in this partition, and e removal of this and the false ceiling nuch more of the old roof was dis- ; a general view of the roof is seen photograph, which shows one of the rincipals (B on the plan), and gives a f the modern fireplace at the end of n, the chimney breast of which may built in between the curved brace of cipal (A on plan).

er find which came to light after the of the lath and plaster end of bed- o. 3 was the curious old framing (D), seen in the photograph, where a had been cut through to get to the other bedrooms; another modern partition can be seen on the other side, and on this being exposed a set of fine curved braces with framed timbers were found. I could find no traces of this having formed an exterior gable end to the building and it must have been a framed partition only. The other parts of the house appear to be of the same period, but have much plainer roofs.

On reference to the plans showing sections of the roof it will be noted that the main uprights to principals A and C continue from the cross collars of roof to the ground floor below, and one upright I traced intact hidden behind a lath and plaster partition in sitting room as shown on the ground plan marked "X."

There is no doubt that originally there was no bedroom floor; it has every appearance of a modern insertion. The roof formed a great hall to what was once an old manor house. The thick walls are of stone and brick of modern construction, probably seventeenth century, as portions of the old oak timber framing which originally formed the walls of the original building are still in position and may be seen in the photos.

There was an old fourteenth-century fireplace found in its original position in bedroom No. 2. One photograph gives a general view, and the other fuller details of the peculiar shaped cap to the side jambs. The modern brickwork has been removed, revealing the old stone back and sides of the recessed fireplace. An exterior view is also given of the stack, which has a modern top added to prevent downdraught.

In the gable end of dining room and bedroom traces of the old framed timber were discovered. This was found covered with lath and plaster but we were unable to expose it as it was much decayed, worm eaten, and past repair, and we had to cover it up again with lathing and re-plaster.

The old roof, I may add, has scarcely been touched by any new work; only the necessary repair work has been carried out, and every care was taken to preserve it so as to leave it in its original condition. Unfortunately we were unable to remove the middle floor, which would have entailed the outlay of a large sum, as the remaining walls were not strong enough to carry the roof if the intermediate floor had been removed, but there is nothing to prevent this being done at any future time if wished.

For the photographs accompanying the drawings the architect is indebted to Mr. Alfred Watkins, F.R.P.S., Hereford.

Catholic Church, Northfleet.

This church, which stands on a commanding site overlooking the Thames, consists of nave, with aisles, chancel, with side chapels, and western tower, in the lower part of which is placed the organ gallery; while the vestry accommodation is situated at the east end of the building. The church is built of Crowborough bricks, the roof being covered with dull red pantiles. A noticeable feature in the design is the frank use of reinforced concrete lintels, both over windows and doors, and also over some of the openings of wider span, which are accordingly square-headed, instead of being of arched form.

The interior of the church is plastered, except as regards piers, responds and quoins, &c., which are of Crowborough bricks. The builder was Mr. J. B. Lingham, of Northfleet.

The architect is Sir Giles Gilbert Scott, R.A.

Whitton Grange.

This house stands on an attractive site overlooking the village of Rothbury and the Coquet Valley. A small Victorian house originally stood on this site, but this was taken down and its only pleasant feature—the coursed stone walling—reused in the new house. The contours of the site are largely responsible for the lay-out of the garden, the ground rising steeply from the south-west and north-west. The walls are faced with local stone, and the roof is covered with "Pricelly" slates.

Messrs. Mauchlen & Weightman, of Newcastle-on-Tyne, are the architects.

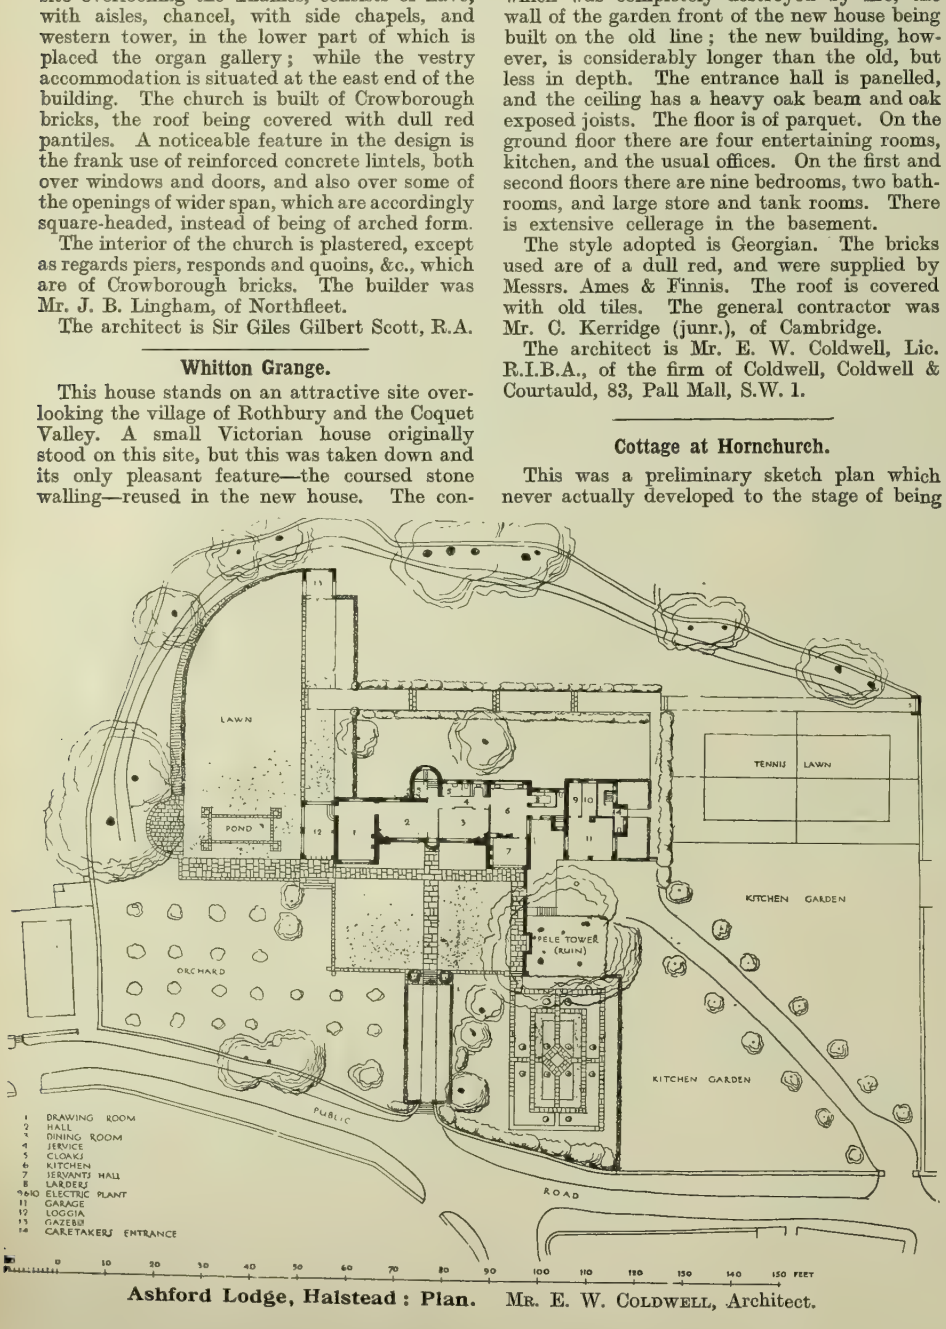
Bank, Amesbury.

This Bank has been built adjoining an old flint and stone chequered house which was used as the bank manager's house. It has been built of local flints and Chilmark stone with hand-made sand-faced tiles on the roof.

The general contractors were Messrs. Mussell-white & Son, of Basingstoke. The bank fittings were made by Messrs. Elliotts Moulding & Joinery Co., Ltd., of Newbury. The principal sub-contractors were: Messrs. Thos. Elsley, Ltd., metal fanlights; Messrs. W. Aumonier & Son, stone carving; Messrs. James Gibbons, Ltd., door furniture; Messrs. The Art Pavements & Decorations, Ltd., floorings; Messrs. H. Pontifex & Sons, Ltd., sanitary fittings. Mr. Edward Maufe, F.R.I.B.A., is the architect.

Ashford Lodge, Halstead.

This house takes the place of a former house, which was completely destroyed by fire, the wall of the garden front of the new house being built on the old line; the new building, however, is considerably longer than the old, but less in depth. The entrance hall is panelled, and the ceiling has a heavy oak beam and oak exposed joists. The floor is of parquet. On the ground floor there are four entertaining rooms, kitchen, and the usual offices. On the first and second floors there are nine bedrooms, two bathrooms, and large store and tank rooms. There is extensive cellerage in the basement.



The style adopted is Georgian. The bricks used are of a dull red, and were supplied by Messrs. Ames & Finnis. The roof is covered with old tiles. The general contractor was Mr. C. Kerridge (junr.), of Cambridge.

The architect is Mr. E. W. Coldwell, Lic. R.I.B.A., of the firm of Coldwell, Coldwell & Courtauld, 83, Pall Mall, S.W. 1.

Cottage at Hornchurch.

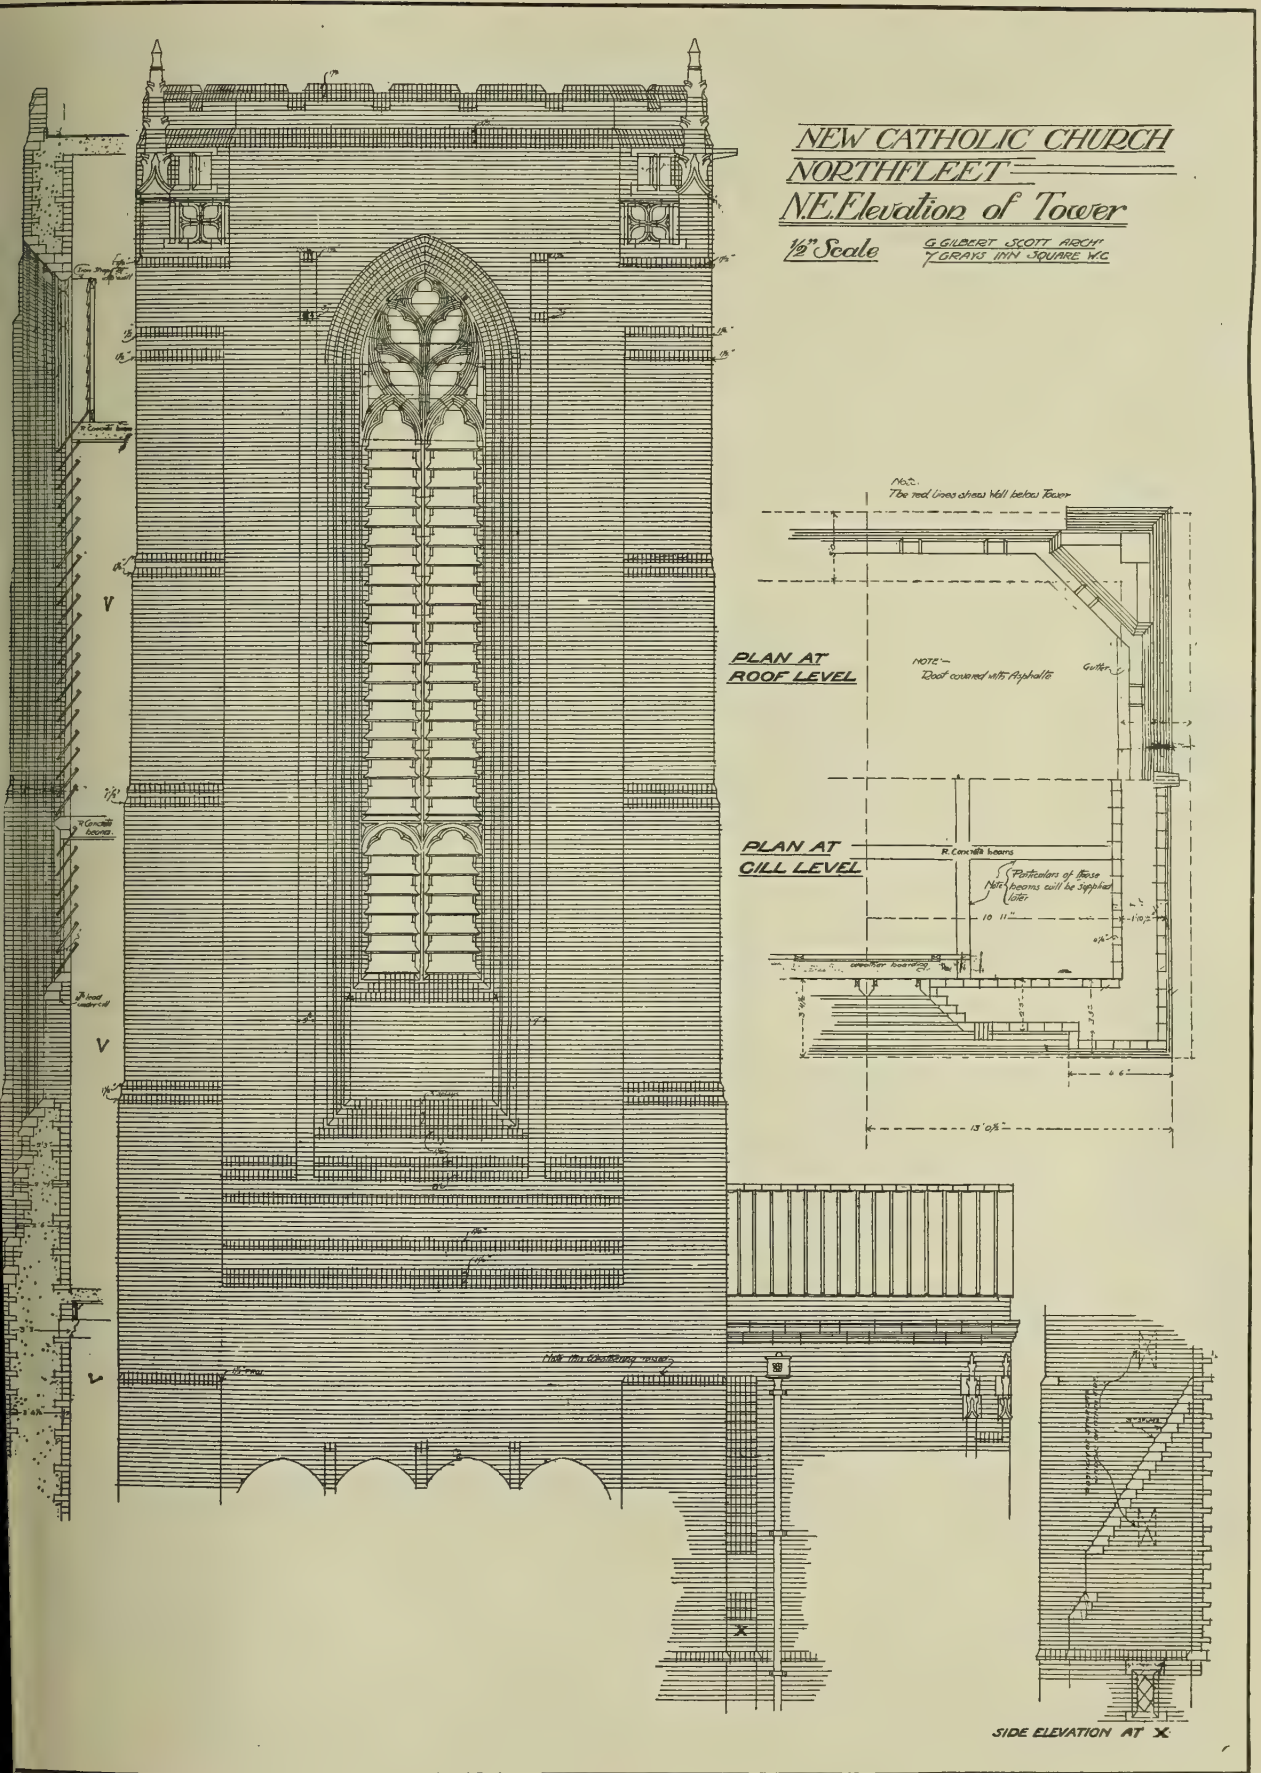
This was a preliminary sketch plan which never actually developed to the stage of being built, owing to unforeseen difficulties wit intended site. It attempts to meet wha fairly frequent condition, where a client rather more accommodation in the bed than in the sitting rooms, and the old dev overhanging the upper story is adopted, has this practical advantage as well a picturesque effect. In the plan the only fe which suggests comment is the omission usual partition cutting off a narrow passa give separate access to the second sitting the gain in spaciousness compensating fo slight loss of privacy in the living room. proposed to build the walls of narrow r coloured bricks and to tile the roof and hanging walls, all external woodwork be English oak left clean from the tool. The of the building was intended to be of the sim relying on proportion and workmanship than on any applied decoration.

The design is by Mr. A. Edgar Ber (Messrs. Baillie Scott & Beresford).

Ashford Lodge, Halstead: Plan. MR. E. W. COLDWELL, Architect.

Winchester School War Memorial Cloi

The cloisters at Winchester School recently been erected. to the design o Herbert Baker, A.R.A., as a war mem The contractors were Messrs. Holloway Ltd. Hopton-Wood stone, supplied by Hopton-Wood Stone Firms, Ltd., was us the fifty-two columns with their capitals bases, and also for the panels on whic names of the fallen are inscribed.



Empire Theatre, Tientsin.

The Empire Theatre, Tientsin, is the portion yet completed of a scheme compr in addition to the theatre, a restaurant, hall, and club premises, for which the de of Mr. Horace G. Turner, A.R.I.B.A. (M Hemmings & Berkley) were accepted in petition. The construction is of brick, finished externally in granite plaster; reinf concrete floors and balcony. The theatr be used chiefly for cinematographic p mances; it has a fully equipped stag theatrical performances with scenery doc dressing rooms complete. The whole sc will be heated by hot water from one house situated at the rear. A sunken roo also been placed in the rear for storage of in hot weather.

Sports Pavilion at Paisley.

The pavilion built for Messrs. Clark & Ltd., at the Anchor Thread Works, P stands in the middle of the recreation gr and is approached through wrot-iron gat along a carriage drive bordered by ornar grounds, laid off in flowering and other s The pavilion has broad terrace steps o north and south elevations, where spec can command a view of the complete grounds during fine weather. At the each terrace is a spacious verandah with columns up which creepers are trained to The two main gables are built of rub several varieties of stone of diverse co the walls under the verandah are of Rave rustic brick with very wide and deep The gables above verandahs are of half- work. The roof is covered with red sand hand-made tiles. The ground floor accom tion is shown on the plan. On the uppe is a gymnasium 60 ft. long × 38 ft. lit by roof lights and dormer windows. A club room and committee room lead gymnasium, access to these rooms being also through the corridor at each end gymnasium. A ladies' dressing room lavatory and similar rooms for men als off the gymnasium. A committee roo secretaries' office complete the upper accommodation. In the basement are lav accessible only from the outside, the l chamber and drying room, stores for car cleaner and gardener, and storage spa general use.

Messrs. Abercrombie & Maitland, of 1, C place, Paisley, are the architects.

ORHAM CASTLE, NORTHUMBERLAND

By WILLIAM HARVEY

Lr on the south bank of the Tweed at a that seems to have been fortified in both n and Saxon times, the Norman castle rham, in the county of Northumberland, as one of the most important strong- of Northern England. It was an e centre of military operations from its l foundation by Bishop Flambard, of m, in 1121, until the union of England cotland under one crown diminished the f fortifications upon the border. It is e, too, that changes in the manner of ting war had thrown the castle out of consideration before this time, and its later years of occupation it was ly regarded rather as a barracks than defensible fort. The castle en several times subjected to demolition, and abounds in ces of restorations and addi- executed in the fashions of nt periods. The original work to have been substantial, and hstanding a report that the had been *Prostratum et dis- ad terrum* by the Scots, a part of the existing walling is rman character, with inser- of later masonry in the sur- of doors and windows. The parts of the castle are claimed he authorities as original, and ir partially dismantled state most interesting example of andard of building craft in d at a comparatively early The planning of the building the older fashion in vogue the Byzantine science of for- on, introduced with the return e Crusaders to England, had t about a revolution in the lay out of ve works.

Norham Castle the keep, a great rect- r tower, ninety feet high, stands upon a mound overlooking a steep gulley slopes down towards the river Tweed he North. Both the mound, and the n the distance are shown upon a print a view of the castle from the south-east ppeared in 1680. (See Fig. 1.) he north-west of the keep lay the Inner or upper enclosed courtyard surrounded ick and high curtain wall joined to the t its north-east and south-west corners. Figs. 5 and 6.) Beyond this on the vest was the Outer Bailey, enclosed by in wall of greater length, which joined ep at a point in its wall near the ast corner (see Fig. 5), and returned t the Inner Bailey curtain on the north side near the river. The inner court was not only separated from the outer by walls upon its southern and western sides but by a deep ditch which, while it doubtless increased the difficulty of attacking the inner court, had the disadvantage of curtailing the accommodation in the Outer Bailey.

These dispositions take advantage of the lay of the land in that the east wall of the keep that is not protected by the curtain walls, is erected upon a bank so steep as to forbid the near approach of the military engines of an attacking force. The defect which the plan of Norham has in common with other Norman castles is that the outer curtain wall was only defensible as a separate work, for the part of

FIG. 4.—INTERIOR OF FIRST FLOOR, WEST ELEVATION; BROKEN STAIR WELL BETWEEN WINDOWS.

the garrison posted upon it could not obtain any very great assistance from the defenders of the inner wall of the keep. The philosophy of the defence seems to have been to reckon upon the possible invasion of the outer court by a hostile force and to dispose the inner works so as to make the winning of it a hard bargain for the invader. This process is reported actually to have happened in the time of Edward II when the Scots were forced to retire after having stormed the outer court and held it without making further progress during three uncomfortable days and nights.

Repairs now being executed by H.M. Office of Works Historic Buildings Branch have included exploratory excavations among the piles of débris in the inner court and adjoining the curtain walls and gates of the castle. These excavations have the double purpose of revealing the nature of such work as remains hidden below the present ground surface and of clearing away the unsightly masses of rubble that encumber the site. At the time of my visit the excavations were far from complete, but had already revealed the foundations of many subsidiary buildings in the Inner Bailey which must have considerably improved both the accommodation and the comfort of the garrison. It is not yet possible to state which of these buildings were in use from the time of the castle's foundation, but the inner side of the curtain wall was probably built against at a very early date to give more space than was available in the restricted quarters of the keep where the thick walls took up a great deal of the area of the plan. (See Fig. 2.) The need of additional room accounted for an alteration which is supposed to have been made by Bishop Pudsey, 1158-1174, when two upper stories were added to the top of the keep. This had at first only comprised three stories, of which the uppermost constituted the State apartments, while the first floor contained the main entrance, reached from the exterior by a stair or gangway from the Inner Bailey. Entrance to the ground floor is obtained at present by means of a breach in the south wall, where an original loophole has been enlarged by pulling down masonry from its jambs and from below its cill. Signs of a door jamb still exist at the north-west corner, the smaller of the two parallel vaulted of the keep at ground level, and another opening remains at the south-west, giving access to chambers into which the ground story has been divided. These rooms retain the major part of their vaulting and are planned upon a generous scale. That upon the north (see Fig. 3) is approximately 58 ft. in length by 20 ft. in width, with a semi-eliptical barrel vault springing 10 ft. from the floor and rising to a height of about 9 ft. above its springing. The setting out of the vault is not absolutely regular, partly owing, perhaps, to the manner of its construction and in part to the movements in the walls of the castle since its erection, occasioned by the wear and tear of 800 years and the state of partial demolition in which they exist at present. Interest is given to these early barrel vaults by the introduction of minor vaults which intersect their surfaces at right angles and give additional headroom to the arches above doors and loopholes in the walls of the chamber

The surfaces of all these vaults were almost certainly brought up to a smooth surface at the time of their construction, but the pointing material has since fallen away exposing the large rubble slabs used as voussoirs. The groin lines are among the worst preserved

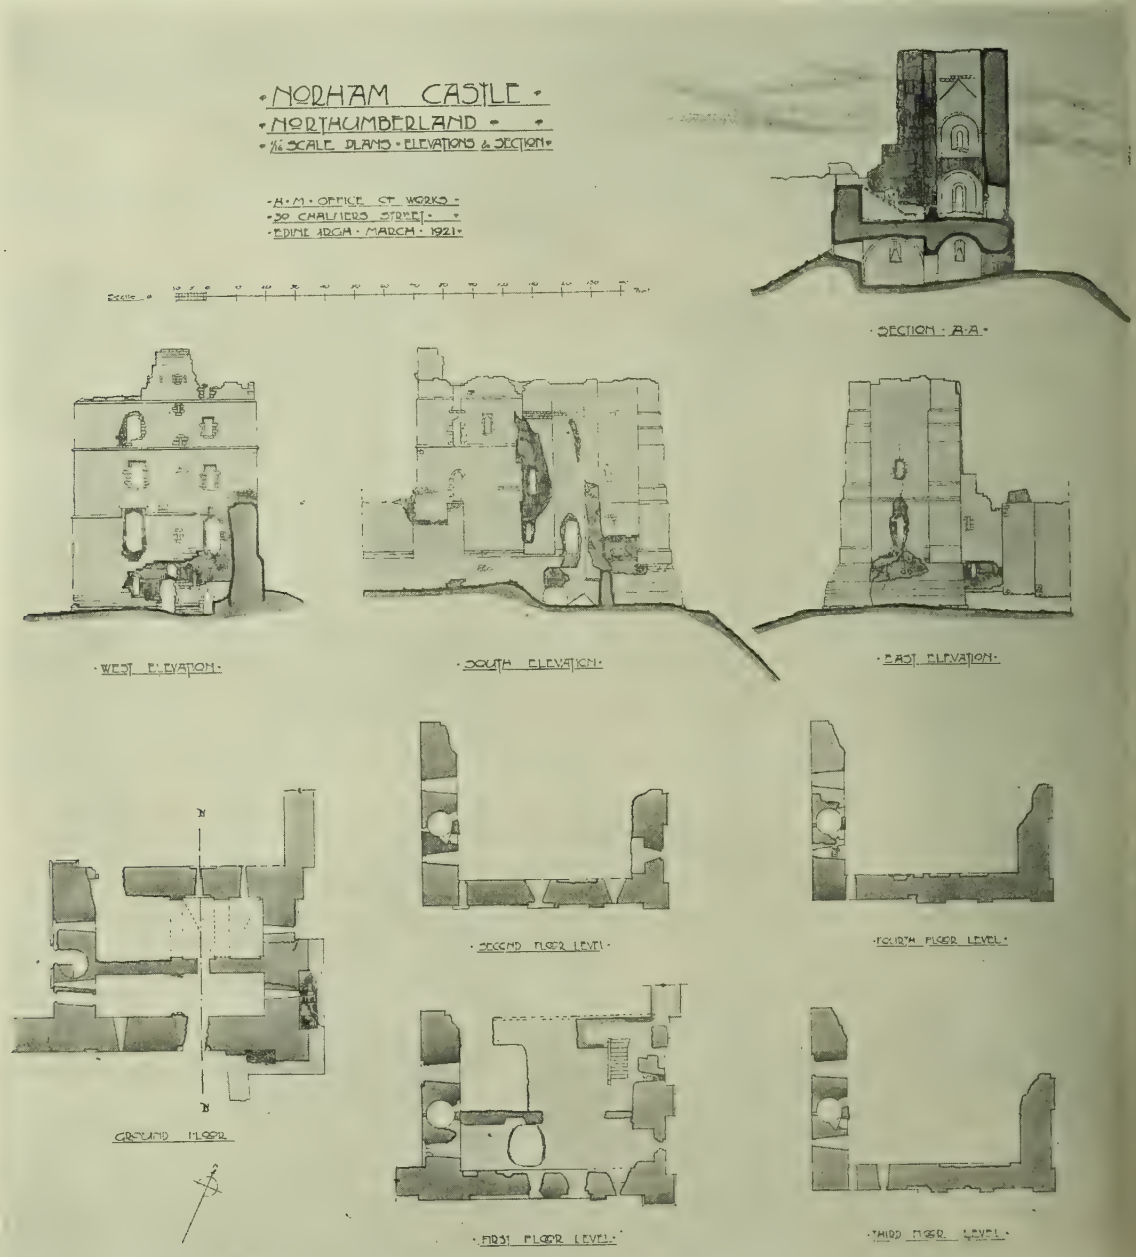

FIG. 1.—PRINT OF THE CASTLE IN 1680, SOUTH-EAST VIEW.

parts, for, being difficult to construct neatly in rubble, the proportion of packing out in mortar and small stones was greater at these places than elsewhere. The fall of the mortar has left the groins in an apparently precarious state, but they are not the only weak points. The loss of the superficial mortar from the vault has been followed by the fall of the stones themselves in some parts and repair is urgently necessary if these most interesting records of the past are to be preserved for future study. Repair will not be easy, for the dilapidated condition of the vault would have been sufficient to have condemned it to demolition at the hands of a Victorian restorer. A more enlightened estimate of the importance of conserving every vestige of ancient work governs the theory of the subject at the present time, and every effort will be made to retain the existing stones in position and accessible to inspection without the addition of an unpleasant array of disfiguring props or a network of steel, such as was resorted to in many monuments before H.M. Office of Works demonstrated the possibility of a more refined method of conservation.

A series of processes has been devised by the Historic Buildings Branch by which the monuments may be maintained by inconspicuous means, and dilapidated and dangerous vaults have been treated and put into sound structural condition by an ingenious process of successively cleaning out the several joints of the stonework little by little and inserting Portland cement mortar into the cavities and driving it by special tamping tools well into the heart of the work. The process is difficult and would be dangerous in inexpert hands, for it is not easy to support an irregular rubble vault upon a temporary centre in such a way as to permit of access to its soffit, but by no other method can such excellent results be obtained. On completion of the repairs the old rubble voussoirs are still obviously original work preserved in its old position, insertion of mortar material has been kept down to the minimum, and where new stones have necessarily been added the masonry is built in general harmony with the remainder, but with sufficient difference of technique to permit a careful investigator to be quite certain as to the limits of old and new. The cement packing is never allowed to appear on the surface, which retains its time-worn character and its interesting play of light and shade i broken texture of the masonry. Harm maintained in the shadowy joint line pointing the work in lime water made coarse pebbly sand, such as was used in t work.

How the Norman builders were enab build groined vaults which, though som irregular, have yet proved capable of en 800 years of rough usage is illustrated by paring such ruins as remain at Ne Castle with the castles and churches structed by the Crusaders in Palestine with the modern house-building in country where similar vaults are still in day use. The unequal curvature in the and vaults at Norham suggests that our n of constructing rigid triangulated t centres could not have been employed to in their erection, and it is possible th more direct method still retained in th may have been used. In that case th cesses would have been as follows. Th closing walls of the compartment would been built first with the rounded lines proposed intersections of vault and wall n upon them by a ledge for the reception

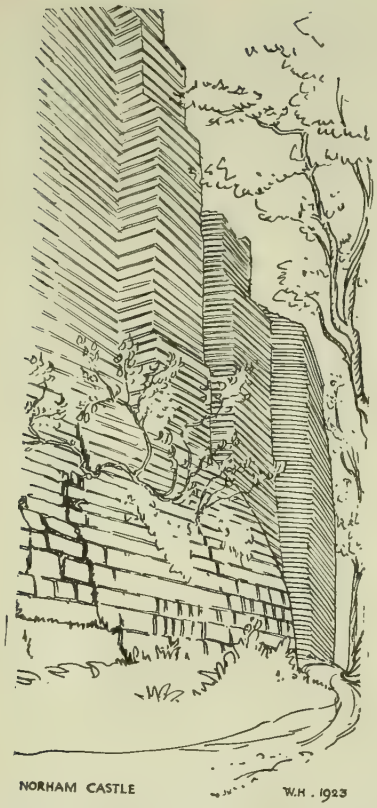
ording to the material and method em-
d in each centre, more or less settlement
take place as the voussoirs were laid.
hick joints of lime mortar permitted of
considerable adjustment as the centre
d under the weight, and the flattening at
own and bulging at the haunch charac-
c of Norman arches, including those in
round-floor vaults of Norham Castle,
come about without being specially de-
d as a refinement and, on the other hand,
nt betraying by fractures that any ex-
e settlement had taken place. The
pt to build arches of approximately semi-
ar curve lent itself to this process of
ng and bulging, and the Normans failed
over the secret of modelling their centres
e thimble contour, approximating to a
atenary curve, that has been used in the
rom time immemorial in connection with
uctions for which non-rigid centres are

For the continuous barrel vaults of rubble and mortar, somewhat similar centres must have been formed. The loss of the original surface at Norham prevents the possibility of any serious conjecture as to the material with which the centre was covered. This may have been earth-supported upon piles of brushwood as in Palestine, though in the Norman undercroft at Westminster Abbey irregular undulations in the surface of the vault suggest that rounded planks or half pine trunks may have been used as the upper part of the centre, the under part of which was of non-rigid character. In any case, the groins of the vault would be represented by sinkings or valleys in the centre, and would be far more conveniently and speedily arrived at in the process of modelling than by elaborate geometrical construction in the setting out, and the wasteful process of cutting squared timber to the curve. These are processes introduced after the practice of vaulting for ordinary building purposes had died out, and, except where justified by the repetition of the same vault, they add excessively to the cost of this splendid form of building.

So much has been written concerning the fine structural economy exhibited in a later style of Gothic vaulting and its abutment, that it is of interest to note that its elements appear in the arrangement of these two vaulted chambers. Considerations of vault management have been allowed to affect the plan throughout. By dividing the breadth of the building instead of its length, two vaults of conveniently small span were obtained, with the ensuing advantage that height could be kept reasonably low and the centres proportionately small and easy to handle. The partition wall, too, which is hardly thick enough to stand the thrust of either vault alone, is economically used to support the springing of both in such a position that their opposing thrusts practically neutralise one another (see Fig. 2). These considerations became still more forcible in connection with the vaults of the first floor, for, at a greater height from the ground, it was imperative that the spans should not be excessive, or the massive side walls of the keep would have been provided with a disruptive force ready to assist any enemy who should undermine their bases. The vaults of the first floor have fallen, and of the partition wall only fragments remain. The springing for the transverse arches was arranged upon corbels in the walls, to still further reduce the span and assist in the thrust management. Articulation is carried somewhat further than in the lower story, for the window openings are larger and would have involved something like concentration of pressure upon the piers between the windows. At a higher level an inclined weather-moulding exists upon the inside of the east wall of the second story, and seems to indicate that formerly a timber roof was used here, as pressure from vaulting would have been difficult to control at this height above the ground. The positions of floor beams are also indicated at two levels near the top of the building for the two stories added by Bishop Pudsey. Access to the various levels of the keep was obtained by means of a spiral stair in the west wall (see Fig. 4). The diameter of the staircase varies from 8 ft. at the top to nearly 10 ft. at the foot, giving more room than is usually associated with stairs of this sort.



The parallel chambers into which each floor was divided were served by separate doors from the staircase, one being placed to the

Fig. 5.—South Elevation.

Fig. 6.—West Elevation.

SHOWING MODERN MASONRY PARTING FROM THE WORK IT WAS INTENDED TO UPHOLD.

north and one to the south side of the central partition wall.

Sanitary accommodation seems to have been provided by means of small wooden chambers projected out from the wall faces on brackets, with access from the interior of the tower by means of small doorways pierced in the upper parts of the walls. As time progressed these provisions were augmented by a new latrine in a separate building, on the west side of the great tower.

The tendency of writers to exaggerate the primitive aspect of life in former times receives a check in the facts that are brought to light by further research, and the newly discovered out-buildings include fireplaces and bakehouses that suggest a considerable degree of comfort.

On the exterior of the eastern side of the keep is an instance of the difficulty of the efficient repair of an ancient structure. New stones had been inserted at some former repair in the slope guarding the foot of the wall. The new patches had shrunk and bushes were growing in the cracks between the old and the new work.

REGIONAL PLANNING IN WALES

WALES not only contains some of the finest natural scenery in Great Britain, but, unlike the Lake District, industrialism also reaches in South Wales its high water mark. This volume* deals largely with the urgent necessity for protecting natural amenities from the inroads of thoughtless development. The introductory notes include an appeal for adequate regional planning in the area that will be affected by the Severn Barrage. Mr. H. M. Vaughan contributes a powerful indictment against the tyranny of the advertiser. In answer to the query *Cui bono?* he asserts that "The only gainers from this continued and deliberate vandalism will be a small influential class of persons who have recently discovered that trees and streams rocks and landscapes own some financial which can, by advertisement, be transm into hard cash. It is this group of exploi who are really the worst offenders in this sistent destruction and disfigurement of countryside, and these people are to be f mainly in our own public bodies. From newspaper reports it will be seen that appeal to a public body on the ground o picturesque or the historical is invari turned down, usually amid roars of igno laughter." Mr. Mortimer Wheeler m much the same complaint, "Before we stones at North Wales, however, let u member that the Great Western main lin Monmouthshire brings hundreds of passe daily to the gates of a fine mediæval c which, battered and bricked up almost be recognition, is now a home for steam m go-rounds and a monument of civic ignor and indolence." Mr. Craven Llewellyn u the afforestation of colliery tips by plan the birch and the Scotch fir. Mr. Try Edwards contributes a review of recent l ing and town-planning literature; Mr. A Lloyd some notes on Welsh town plann and the producers are to be congratul upon an excellent all-round issue.

Cottage, Chaldon Mount, Chaldon, Surrey. MR. HORACE G. TURNER, A.R.I.B.A., Architect.

[This cottage is constructed of brick walls and reinforced concrete floors. The roof is of tiles. There is only one fire, which is used for cooking and heating; it can be turned to be seen in the living room or the hall. Radiators are placed in all the rooms, including the bedrooms, and so heat the whole cottage.]

New Printing Works, Croydon. MR. F. SUTTON SMITH, Architect.

The front of this building is in Epsom red facing bricks, with stone dressings supplied by the Patent Impervious Stone Co. The piers are in Southwater engineering bricks in cement, and the remainder of the walls in Warnham common pressed bricks. The first floor and roof are of reinforced concrete, reinforced with B.R.C. fabric. The roof is similar to floor, in order that another story may be added later. The offices and first floor are finished with wood blocks and the remainder of ground floor and basement with granolithic paving. The chief feature of the design is that there are no columns to support the floor or roof, thus giving more room for large machinery. Another feature is all partitions are removable, being wood glass panels, whereby when a department g or diminishes the partition can be m accordingly. All windows are Crittall's "F tia" sashes. Messrs. Alfred A. Secrett, of Wallington, were the builders.

BOOK REVIEWS

nal Architecture in the West of England. y A. E. Richardson and C. Lovett Gill. London: Ernest Benn, Ltd.) Price 42s.

TE rightly, the authors of this work have to regard the architecture of England the regional, rather than from the county, of view. They are a little unfortunate, er, in their title; not only are their refer- almost exclusively confined to the south- but they very properly keep within on which, owing to its sea-faring history, anite, its red sandstone, and, generally, its ar detachment from the rest of England, most decided character of its own. Its nth and seventeenth-century architecture us indications of a direct relation with , Holland and France, whilst the eighteenth ry is exceptionally rich in finished examples architecture and architectural engineering period, such as a capital city like Dublin linburgh might well be proud of. It has been a sailor's county, and its long ation with the Navy, which is sheltered rovisioned here, makes it a place of retire- both for officers and men, and there doubt but that it was owing to the vast of money that were spent on the Navy, ularly at Plymouth, that such eminent ects as Foulston, and such capable eers as Rennie were attracted to a locality , otherwise, was far and remote. Foulston r Plymouth what the Woods did for Bath Grainger for Newcastle—his work is later that of the Woods and consequently of , rather than of Roman derivation, but not been for one or two fine interiors, like roprietary Library at Plymouth, one would had to regard his work as sterile, unin- ing and lacking in everything but style. it certainly had, but it was a cold style. me as the unfortunate link between the cised Italian of the seventeenth and early enth century and the resuscitated Italian rhaps, Nash, and certainly Barry, Walters rick, and a nineteenth-century school. In orks of Charles Fowler, as illustrated in Lower and Higher Markets at Exeter, we more original treatment. The common- proportions of Foulston are bettered by uition, a natural treatment of the problem, refinement of detail that compels us to and admire.

later work of Rennie, as seen in his Victualling Yard at Stonehouse, affords excellent example of engineering archi- e or architectural engineering of which e in so great need to-day. It is not, of , like Blenheim, a great architectural or is it a sedately disposed example of the of a great architect, like Greenwich, but big commercial building, designed by an er, and with pretensions to architecture, ter example exists in the country.

authors have approached their subject he right standpoint—the regional and the c. Their extraordinary knowledge of untry, and their wide studies of the archi- of the period, enable them to rush us he ground with a breathless enthusiasm ill not allow us to lay down the book he whole of their discoveries are revealed. from their scholarly references to the more ant architectural examples from towns xeter, Plymouth, and Truro, they take recesses of the country and, showing us raphs and sketches, describe endless les of minor works, which form, perhaps, ost useful and charming chapters in the Of particular interest is a house at h by Nash; stone houses from Truro, 1882, not those dated 1805, which never to have appeared. In the Isles of Scilly arming little houses which remind us of les we have seen in the Channel Islands. eem to have the same aptitude for im- ng detail, but at the same time retaining mple breadth. The porch over low entry, Town, St. Mary's, in the Isle of Scilly, s all that we mean.

book suggests that there is still room for other works on Regional Architecture in other areas of England. It was a happy idea to present the architecture of South West England to us in this way.

A Short History of Hampton Court to the death of Charles I. By Ernest Law, C.B. (London: G. Bell & Sons, Ltd.) Price 6s.

It occasionally occurs that an old house has been so closely associated with the distinguished persons by whom it was built and occupied that its history is largely identified with the histories of those persons. The history of the place can be understood only by following the lives of the successive persons who owned it. When this is so, as is the case with Hampton Court, the danger of paying too much attention to the personal aspect to the neglect of the other is obvious, but when a just balance is maintained between the two a vivacity is imparted to the narrative which assures the attention of the reader, and therefore assists in the assimilation of the instruction given. The author of this work has been successful in maintaining this balance, and has so treated his subject that while his material bears the very impress of documentary foundation the narrative throughout preserves the absorbing character of a fascinating novel.

The manor of Hampton, which is mentioned in Doomsday Book, was acquired by the Knights Hospitallers of St. John of Jerusalem in the thirteenth century, and was occupied by a preceptory of sisters of the order until 1514, when it was leased to Wolsey, then Archbishop of York. Wolsey, who was then rapidly rising in wealth and power, had taken great pains to secure a healthy spot near London, and having acquired this site proceeded to erect upon it a palace which ranked among the first in Europe. Its rich decoration and sumptuous furniture, its splendid tapestries, which were changed once a week, its lavish accommodation for guests and retainers called forth not only the satire of the Cardinal's enemies, but the wonder of the foreign ambassadors who waited upon him. Wolsey's sanitary arrangements were on a most advanced scale. Pure water was brought from Coombe Hill, about three miles away, in two lead pipes which were carried under the Thames above Kingston bridge; baths and other conveniences were installed, and the drainage system was so excellent that it was not necessary to interfere with it until

South Porch of Notre Dame, Dinant.

From a water-colour by Mr. John Keppie, A.R.S.A., F.R.I.B.A.

[This porch is an interesting example of Belgian Gothic of the thirteenth century. The building is situated on one side of the Grand Place, leading to the bridge from the town to the opposite bank of the Meuse. Both bridge and cathedral were destroyed by the German bombardment at the beginning of the war.]

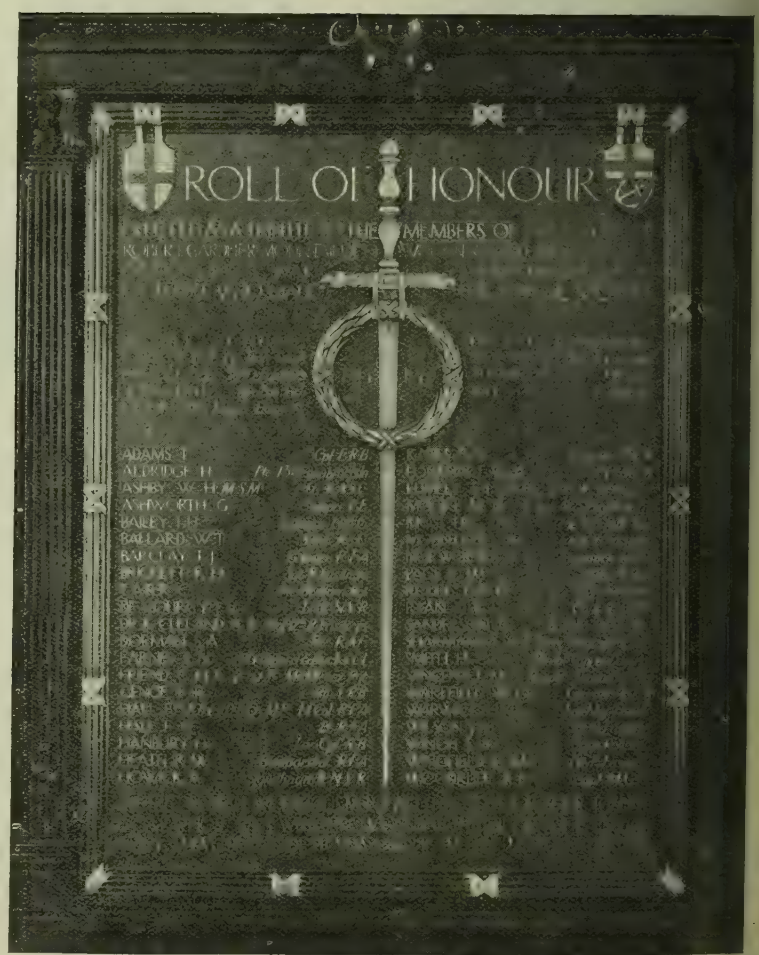
1871. On the acquisition of the palace by Henry VIII extensive additions were made, the great hall with its magnificent roof built, and much decorative work carried out. Henry also obtained the fee simple of the manor from the Knights Hospitallers.

The author's narrative of Wolsey and of Henry VIII and his successors, as connected with the palace, is well written and contains many references of great interest, such as the Christmas masques and plays conducted in the great hall. The volume is profusely illustrated throughout with good drawings, photographs, and reproductions from old prints, and there is an appendix of historical notes on the opening of Wolsey's rooms.

The Church and Parish of St. Dunstan in the East. By ARTHUR G. B. WEST, M.A. (Rector). (Simpkin, Marshall, Kent & Co., Ltd.). Price, 2s. 6d.

To all who love their London—and they must include the vast majority of us who have the privilege of working or living here—the landmarks which distinguish our city and are closely connected with its history and mark its progress are invaluable possessions. It is obvious that in the process of time, the advent of new requirements, the inevitable change of circumstances, and the general process of decay must often necessitate the reconstruction, or perhaps the entire removal, of some of our cherished monuments; but while such drastic measures are inevitable in secular buildings of continuously changing uses, it is only in extreme cases that they are applicable to a church, the purpose of which is constant. The church of St. Dunstan in the East is one of the nineteen churches recommended for suppression by the Commissioners of 1919. They advised, it is true, that the tower of St. Dunstan's should be allowed to remain, but, apart from the religious side of the question, one need only point to the forlorn aspect of the tower of St. Mary Somerset, in Upper Thames-street, and similar examples, to realise the effect of such a policy. Wren's tower at St. Dunstan's, with its fine stone crown, is of similar character to that of the old church of St. Mary-le-Bow destroyed in the Great Fire, and is a priceless heritage.

The handbook by Mr. West is a valuable contribution to our knowledge of parochial history, and consists largely of extracts from the Vestry books and churchwardens' accounts of the parish. We could wish that, in a work of this restricted size, many of the extracts were eliminated, so that space might have been found for a fuller description of the successive churches and of the ancient parochial buildings, as the title seems to suggest. But some of the extracts here given are of great value, as for example, that of the Indenture specifying the terms and extent of the contract for the enlargement of the church in 1382. The account of the penance imposed on and performed by Lord and Lady Strange, in 1417, following on a fatal strife in St. Dunstan's church, in which they were implicated through their servants, throws a most vivid sidelight on the history of the period, "that their servants in dresses betokening shame and penance should walk before the Parson of St. Dunstan's from St. Paul's to St. Dunstan's church; then the Lord Strange bareheaded, and his wife barefooted; Reginald Kenwood, Archdeacon of London, following them; and at the hallowing of the Church, the lady should fill all the vessels with water and also offer an amount of ten pounds. And the Lord Strange should offer a pyx of five pounds."



Four appendices at the end of the book are devoted to the monuments in the church, a list of Rectors, the communion plate, and a description of the organ.

Old English Furniture: I, The Oak Period, 1500-1630. By J. T. GARSIDE. (B. T. Batsford, Ltd.) 10s. 6d. net.

Mr. J. T. Garside's book—Section 1, The Oak Period, 1500-1630—is a useful and welcome addition to the rapidly growing literature on furniture lore. We understand from the title-page that it is for the use of collectors, designers and students, and that the writer is lecturer on the history of furniture and decoration at the Regent-street Polytechnic. We think the students must be happy in their professor. Mr. Garside has done so well in this first section that we feel sure he might have done better had he thought fit to elaborate his subject more freely. Terseness is a virtue often more honoured in the breach. For example, in figures 47 and 48 we are introduced to "dressers" of the late seventeenth and early eighteenth centuries, as distinguished from the earlier "court cupboards" and "dressoirs" of Tudor days, and the author's general remarks upon dressers and their history are contained in seven lines of type neatly centred in an otherwise blank large octavo page. The two dressers exemplified are of the type with unenclosed lower sections, and the author might with advantage have introduced us—textually, at least—to the eighteenth-century type with enclosed cupboards—the last word in movable-dresser space economy and the actual progenitor of to-day's kitchen fixture. It may be objected that this would infringe too much upon the subject-matter of the volumes to follow; but on such subjects one cannot, or should not, work in watertight compartments. The section devoted to tables, giving eleven examples from the Tudor trestle and melon-bulb leg to the gate-legs of Jacobean times, is quite comprehensive and helpful; and so also with armoires, court cupboards, chests, and chairs.

In the preface the writer says that he "has arranged the material on such a system as to be readily accessible for reference purpos at the same time has tried to keep hi theme—the evolution of design—always to the reader's mind. With this end i all the illustrations have been carefully c and reproduced in line, thus giving de and emphasis, and showing constructive q of design rather than mere pictorial That particular form of illustration—lin have been the author's original intentio nevertheless, eighteen of the plates are duced from photographs and they are done that very little definition or em is lost.

The illustrations exhibit good judgm selection. Therein we have—in line an good definition—some three or four h details of carvings, turnings, and applie ments, which occur in the make up or mentation of old English oak furniture. actual or approximate, is appended to each and we can trace, at a glance, the evo or perhaps involution, of the baluster ta of 1697 from the "cup and cover" of and the deeply carved "melon-bulb" of We can trace English panelling from th fifteenth century "linen folds" and "p mins" right through the "Romayne" lions and conventional floral designs Renaissance to the inlays, geometrical n ings and split-balustrades of the seven century. The oak tree is indigenous to o and old oak furniture is typical of the stout heart of our forbears; it is likeable stuff, a more we see it or read of it, the better we

A City War Memorial.

MESSRS. BOURCHIER, TATCHELL & GALSWORTHY, FF.R.I.B.A., and MR. G. C. WILSON, A.R.I Architects.

[This roll of honour has been erected at Ocean House, London, E.C., to commemorate a members of the house of Messrs. Robert Gardner, Mountain & Co. who served in the war names on the right and left of the laurel wreath are those who made the supreme sacrifice lettering is incised on a mahogany panel, the names of the fallen in red and the rest of the let in gold. The heraldic shields are those of the City of London and Lloyds. The whole construction and carving is the work of Messrs. G. A. Brown, from the design of the architec

ld like to say one word about their itute building. It occupied one of sites that could have been found for whole of London, and it possessed in istinction and dignity which rendered worthy of its prominent place amidst the many notable buildings in its immediate vicinity. They should be proud in their possession of it, and he thought their pride would be shared by the architects whose skill and taste had given them such a headquarters for their members.

At a general meeting of members at the Kingsway Hall on September 4, Mr. J. Geo. Head (Past-President) read a paper on "Housing—the Common Task." In the course of his remarks he said there was little need to apologise for bringing forward the subject of housing, since it figured more largely in the public interest than any other, even in this time of serious and numerous problems. It might be said to hold the public attention on every side. It invaded every area, political, judicial, financial, domestic and social; Parliament was constantly occupied in attempting to solve its problems; the Law Courts were kept busy interpreting the complicated Acts which were passed, and adjusting as far as possible differences which inevitably arose between the various parties affected by the legislation; by-elections were fought on housing as the predominant issue, and the newspapers were full of articles, reports and correspondence on every aspect of the matter. For these reasons the subject of housing was forced upon their attention, even though they might not belong to that very numerous class of persons who were personally effected by the existing conditions. The whole problem was one of great intricacy, and it was useless to underrate the difficulties with which the authorities were confronted.

The trouble might be stated simply—there were not enough houses to go round. The remedy, however, was by no means simple. In fact, it was a problem of the most complicated order, the solution of which was a matter of very great difficulty. In the first place, shortage had not always been present. In 1908, for instance, the state of things then existing was depicted by the following quotation from a paper on "Giant London," given by the writer before the Surveyors' Institution: "Large numbers of premises were vacant in every locality, and there are suburban roads where house-agents' boards are almost as plentiful as chimney pots. In 1901 there were 15,000 houses empty in the County of London; in 1907 the number had increased to 41,600, and according to a leading daily paper in the Spring of 1908 it exceeded 50,000."

Nowadays, the number of empty houses was negligible, and an advertisement of a house to let produced a queue of applicants. The reason for so great a contrast was, of course, to be found in the relation of supply to demand. In 1908 the surplus was attributed to over-production. Since then production had not kept pace with demand; indeed, they had had a falling production, and at the same time the demand had increased rapidly. In order to cope with the normal pre-war increase in population and other causes, about 70,000 houses were required every year, so that the construction of new houses to that figure would have kept things level in ordinary circumstances. But the production had fallen far below that standard.

In estimating the needs of the nation in the matter of additional dwellings, it would first be necessary to see whether anything could be done to increase the capacity of the houses which already existed. This had been done in other countries, particularly, it was said, in Germany, where the sub-division of existing accommodation had been carried out in an uncompromising manner. The authorities there, having first of all ascertained the capacity of every house, apportioned out the rooms to those in need of dwellings, on the basis of the minimum amount of accommodation necessary for each person. But without proceeding to such extreme measures it might be possible to stretch somewhat the existing accommodation, as follows: First, attention should be directed to those thousands of buildings, existing in London and elsewhere, which were designed and built to suit conditions which had passed away. They were large roomy houses, having several floors, which were quite unsuitable for modern requirements, which were expensive to maintain, and which, except for the present shortage, would be untenanted in large numbers or be let at very cheap rents.

The problem, therefore, narrowed itself to this—"How to provide the new houses." Successive Ministers of Health had made many attempts only to find themselves impaled on the horns of a dilemma. Houses did not grow; they had to be built, and they cost money in large sums. There were only two agencies capable of producing them—one of those agencies was private enterprise and the other was public authority. In normal conditions the vast majority of dwelling-houses were produced by private enterprise. Before the war, 95 per cent. were so produced, public authorities, philanthropic and other societies being responsible between them for only the remaining 5 per cent. Hence it was abundantly clear that private enterprise was by far the most potent agency, and that if conditions could be so arranged as to utilise its energies they would be on the shortest road to getting the houses. This had been done in part. Subsidies were offered which enabled private builders to put up houses even when the cost of building was higher than it was now, and to sell them at prices which occupiers could afford to pay. Even now that those subsidies had been reduced, houses were springing up in large numbers all over the country.

But—and here came the crux of the difficulty—those houses all belonged to one of the two great classes into which the required houses were divided; they were practically all to be sold to occupiers. True, that was a great help, because not only did every house built and sold for occupation provide another home, but it generally freed one for occupation by someone else. Nevertheless, it left the second class of house untouched, viz., the house which was built and sold for the occupation of other than the purchasers. This was not only by far the larger class numerically, but it was also the class of the inhabitants which were least able to take care of themselves. The people who inhabited the houses in this class, including all those who could not afford to buy their houses, were dependent on the protection of the Government, and in their interest the authorities had decided to retain the restrictions still longer. The result of this step was practically to exclude private enterprise from erecting or buying houses for the occupation of others. Could one really expect anything else? When an investor realised that rent was restricted; that the owner could not get possession even from a bad tenant; that the procedure even for the recovery of rent in arrears was so slow as to be practically inoperative, was it strange that he was alienated from that class of investment? Nor was it to be expected that he would be reassured by the fact that new houses were themselves excluded from the restriction, so long as the speeches of any of those who supported the restriction conveyed the idea that not only was this form of legislation directed against property owners at present, but that the campaign would be intensified in future.

The second agency capable of producing houses was the public authority. Parliament could undoubtedly produce the required houses through the medium of public authority. The precedent had been set, and during the last few years over 250,000 houses had been built by them, all belonging to the second, or letting, class. But many disadvantages had revealed themselves in the course of the undertaking. From circumstances inseparable from public undertakings under those conditions, the buildings were specially costly to build, ranging from £1,000 to £1,250.

In the evening the conference held a banquet at the Hotel Cecil. The following days were devoted to excursions to various places of interest.

A SCOTTISH APPRENTICE SPEAKS HIS MIND

[Although we do not necessarily agree with all that is said in this contribution, we print it because it no doubt gives an idea of what many architectural assistants are thinking.—ED.]

WE young men have been remarkably docile until quite recent years. We have accepted the condition of things as they are with a stoicism either superhuman or supremely simple. It depends on the individual. There was always the voice of authority speaking with the ponderous gravity of age and a ripe experience. But the question is being asked among us in whispers:—"Is it authority, beneficent and wise, that is speaking now?"

Authority, in its established institutions, cannot blame us if the very recent examples of its indecision and divided counsels in face of our critical problems are driving us to impatience and a passionate criticism. The question has evolved itself into the following terms, and it is better it should be frankly stated and openly discussed.

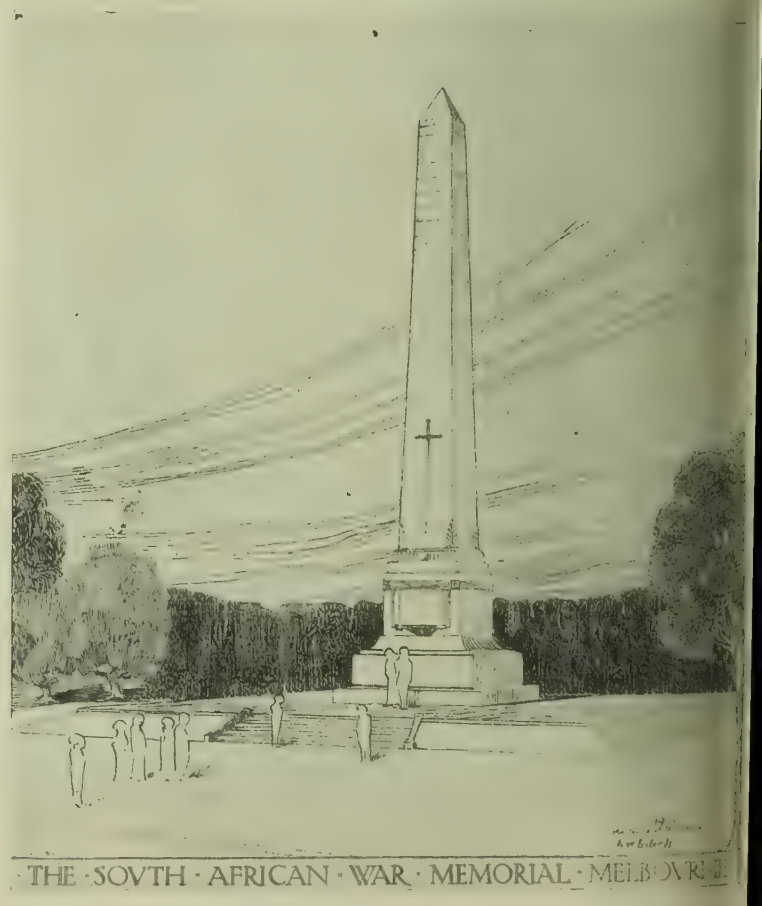
"Is the young man getting his sporting chance of a fair field and no favour?"

The practical answer to that question has been translated into definite action. In our own, as in most other professions, there is a union—which is as yet the only representative vehicle for the expression of the aims and aspirations of the young and necessarily struggling professional worker. I say deliberately it is unfortunate that the bizarre conditions of our times have made such a step necessary in any profession, with its unfortunately intense pre-occupation with the subject of "wages." That is not the chief end, and should not need to be even one of the chief aims of a great art. The creative labourer in a sane society would be ten thousand times worthy of his hire. While the great problems so vitally affecting us as men are being discussed over our heads, and perhaps for that very reason left unsettled, we look forward mournfully to a dreary round of donkey-work up the back-stairs. We are assistants, and doomed, so we are warned, to remain assistants. Hence our pre-occupation about the size of that, to us, almost microscopic "Minimum Wage." To such a pass has come the great art of architecture.

We play glibly and uncertainly with the conventions—what Stevenson so aptly termed "the petty artificialities." Where are the pioneers? Where, to-day, is that spirit of enterprise and initiative that made our western civilisation the keystone of progress? It is certainly not with the creative artists, where it should be. It is more likely to be found to-day with the whole host of ephemeral workers that are the peculiar offspring of our age.

I could submit more patiently to an era of sky-pilots than sky-writers such as we are tending to. The age of sky-pilots at least produced cathedrals, while we architects are at a loss before the aeroplane, though it is, after all, merely a habitation that has taken the air, and has still to come down to the earth again. A study of the orders will not produce an æsthetic concept for that; nor for the automobile that is only a habitation on wheels; nor for the whole host of purely ephemeral habitations that our hectic age is producing without our aid, and that shriek for some expression of their purpose.

Before all the tremendous developments of almost superhuman activity to-day, we architects grumble about an overcrowded profession, because we have forgotten the intrinsic function of our art, which is to clothe the crude works of material minds with their essential spiritual significance. The orders of architecture will not do that in our day; but it is our day we must serve, and inspire, and express.



We must face the brutal facts. They are not encouraging. It means throwing our dreams through the window. Stand up, dear misguided fellow devisor of castles on paper, and take a good look through that same window. See that ugly row of jerry-built houses across the street? They are overcrowded with harassed, hardworking fellow citizens. See that gaunt ugly pile of factories in the distance? The majority of your fellow citizens work in such places. On all sides of your window you can almost hear that cry—not, mark you, for merely beautiful buildings, but for convenient buildings. Your long-suffering fellow citizens are crying out for decent houses to live in comfortably; for decent places to work in efficiently; and for decent places to play in. There, in simple terms, lie your prospects—yours and mine.

Whether these places remain as heretofore, resting on the earth; or take, as they have done, to running on it; or flying over it, or under it; or to sailing on the seas—all this, I submit, has only widened the field of our opportunities; if we can only widen our outlook to them. Oh, but this isn't architecture! Alas for our age and our education! Are we going to follow in the wake of the copybook dilettante in the futile battle of the styles, and leave the practical solution of these modern problems to the engineer, the estate agent, and the jerry-builder, all because Vitruvius and Vignola never heard of them? What we call a profession is overcrowded because we have failed to advance with the times.

Had the engineers worried about their dignity, and as narrowly defined their purpose, they would still be occupied with roads and bridges, and grumbling about their lack of opportunities. They have been too busy developing their inventions (some of them should be ours). They do not mistake the means for the end and make a fetish of their drawings. They are not artists. Ah, what a nice thing it is to be an artist after all. . . . Thus ruminating we continue to attempt to imprison this go-ahead twentieth century into the form centuries that have passed.

I am convinced that if we young r begin to think more about our work about accepted opinions, and the definitions and ideas we have inherit the past, there will be fewer of us as the doormats of City board-rooms vestibules of Council chambers as t avenues of progress. We may even make designs merely. We may becom tects really and truly and produce b which is what the public are crying for are to become masters in this sphere of we must exercise our statesmanship a lead. Governments, institutions, and have a notorious knack of following the whether they be artists or scientists. going to be precious little demand for to public libraries, and the kind of arch we have been taught to produce. T reason why we should walk down our ugly streets with our brows in the simply will not pay either in terms (which is supposed to talk) or in salvatio still quietly nags at our conscience).

If we are true to our calling, we wil to create lasting works; but, as we m in an age that shows a childish passion ephemeral, we must put our pride a conventions behind us and go on something that will shelter mankind fr elements, striving as best we can to exp poetry of our human needs in this our diverse and capricious mood. That prospect which faced the first architect the problem that must face the last. stand before some of our new build begin to wonder if we are not going to last.

[This design was selected by public competition for the Victorian State Memorial who fell in the Boer War, and commemorates the first occasion on which Austral forward in appreciable numbers to take part in England's wars. The site is an triangle, facing St. Kilda-road, one of Melbourne's most beautiful boulevards. The used is Victorian grey granite, a somewhat similar stone to that of the Rubislaw Quarries. A but slightly coarser in grain. Its height is approximately 80 ft., and weight 300 tons. The a are Messrs. Irwin & Stevenson, AA.R.I.B.A., of Melbourne.]

ARCHITECTS' AND UILDERS' INQUIRY BUREAU

are glad to give questions and answers not accept responsibility for contributed especially on legal matters.

we appeal to our correspondents to their queries on paper of a size easily nd written as legibly as possible, or still, in typescript?—Ed.

The Possible House.

LY TO MR. EDWARD A. JOLLYCE.]

For some years the Ministry of Health power to authorise the relaxation of by-laws in favour of approved methods ruction, but the initiative thereon has been left with the local authority. there have been signs that the Ministry giving more active encouragement in ction.

from such regulations as that requiring ing up with brickwork of half-timber hich, if bricknogged, is in itself a very resister of fire, the by-laws themselves n a very fair minimum standard of onstruction, and something more than mism of patentees is required to give ion for their relaxation.

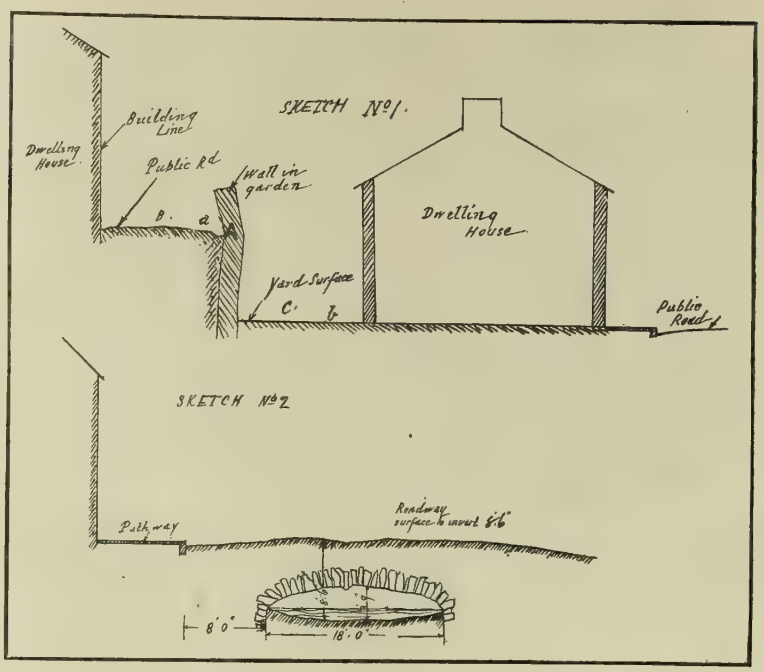
ooks for a very active campaign of n and enterprise, either on the part ickmakers or some other body, to bring k-built house once more to the fore- the best and cheapest form of con- that it naturally is, when free from influences.

will be far better than flooding the with houses built in untried methods ful fate.

"CONSERVATIVE."

Distemper and Asphalte.

[REPLY TO "CITY."]



have not previously heard of a ase to that quoted by "City." Rock is composed of nearly pure carbonate mpregnated with about 10 per cent. al tar-bitumen, and it should not be le to what I should look upon as in application of a lime slurry.

y the asphalte is artificial, and this is ss satisfactory. An improper mixture liable to combine with the lime and e the blisters. It would be well to advice of a good firm of asphalte s.

"DOUBTFUL."

Boundary Walls.

Who is responsible for the repair of a s wall, Sketch No. 1, (*a*) dividing the d (*b*) from the yards (*c*) of a range of houses; assuming failure of wall to be) scour from rain or surface water on rdinary traffic on road; (2) time and to weather or natural decay; (3) the of youngsters loosening and removing the public side of wall? How may walls ositions, the repair of which the local (a County Borough) is responsible stinguished from those which are to ined by the private individual? If ons were reversed, that is, assume (*a*) surface of a private garden, and (*b*) e road, how would this affect the

No. 2 shows a section through an arch ubble masonry beneath and parallel ublic road. The arch is failing, and 10 yds. run has to be made good, uld be diverted. The position is the rise and fall of the tide, but eriods of five hours would be obtained rise and fall of tide. During this flow of from 6 in. to 12 in. would continue through arch. The side walls or abutments are bad, and the partial repair of the arch is not possible as it is too bad. This is only a section of the arch, which is a long one. (1) What do you consider the most economical means of carrying this section of roadway; (2) what R.S.J. and concrete would you suggest for such a span (a steam road roller will pass over it); (3) what constants would you adopt for labour on such an arch in (4) brick (5) in stone rubble?

"BOUNDARY WALLS."

Pipes.

[REPLY TO MESSRS. SHAW & STABLES.]

SIR,—The writer has laid pipe lines in tropical countries to convey drinking water, which had to be kept cool and fresh. It was ordinary ball and socket clay pipe unglazed, with tight joints. Water percolated through the shell and was evaporated by the sun; this evaporation having the effect of cooling the water that was flowing through the pipe. The inside temperature was controlled by the rapidity of the evaporation, this in turn being influenced by (*a*) the air temperature, (*b*) the porosity of the pipe, and (*c*) the head which through pressure would increase the loss through the porous walls.

The air temperature, of course, depends upon sunlight and exposure. The porosity of the clay can be controlled in manufacture. It tends to diminish with length of service if the water contains silt or mud. The head can be governed by using glazed pipe for all portions of the pipe line lying more than five ft. below the hydraulic gradient, and burying such portions of the line, the unglazed portions being uncovered, or very lightly covered with soil. The loss of water through evaporation necessary to appreciably cool the water in the pipe is considerable.

"ENGINEER."

Laying of Bricks.

[REPLY TO MR. A. E. FLOWER.]

SIR,—Mr. Flower seems to have misread Mr. Wenning's suggestion. The wall proposed was not built solid in brick on edge, but with a 3 in. cavity, viz., in two 3 in. shells, and there would thus certainly be a saving in material.

"M.A."

[REPLY TO "TRADITION."]

SIR,—With reference to *The Builder*, of the 5th inst., I beg to invite "Tradition's" attention to the fact that it is not necessary to throw the entire weight of the superstructure upon the inner shell.

In the case of one of the systems of building cavity walls, the reinforced concrete piers—to which the outer (concrete) and inner (breeze) slabs are secured with bolts and nuts—have corbels projecting on the inner side to take the wall plates. It will be seen, therefore, that the piers take practically the whole weight o the superstructure in addition to the slabs (outer and inner shells).

W. F. KENNELLY.

Composition Floors.

SIR,—What is the best treatment for a special, jointless, composition floor, the surface of which is crumbling, leaving underneath a whitish powder, as though the composition were disintegrating? The flooring, which was supposed to have been made up from deal sawdust and is buff colour, has been laid for just over three years, during which time it has been polished regularly.

"KERB."

Cement Wash.

SIR,—We should be glad to know if any of your correspondents could inform us of a satisfactory way to mix cement wash for colouring old external cement work.

We have tried killing the cement and mixing it with soft soap.

"G. O. M."

Carmarthenshire War Memorial.

The County War Memorial was recently unveiled at Carmarthen by Colonel J. V. Campbell, V.C. The memorial was designed by Sir Goscombe John, R.A., and is situated on a pedestal of Scotch granite in front of the Carmarthenshire Infirmary. The contractor was Mr. Henry Evans, Brisken House, Llandilo, and Mr. E. V. Collier, M.S.A., Carmarthen, was the architect.

Bartlett School of Architecture.

The prospectus of the Bartlett School of Architecture, London University, for the session which begins on October 1, has just been issued. The courses of study include (1) The B.A. (Architecture) Degree Course, (2) The Diploma Course in Architecture, (3) The Certificate Course in Architecture, (4) The Advanced Design Course, (5) The Atelier, (6) Evening Courses in Design of Buildings.

THE BUILDING TRADE

TRADE UNION CONGRESS

THE fifty-sixth Trade Union Congress opened at Hull on the 1st instant. Mr. Purcell's presidential address covered a wide field, including questions in connection with the treaty with Russia and the London Conference, and other political matters with which, in these pages, we are not concerned, but the whole of his address was strongly "anti-capitalist," and we cannot but regret that, however ardently he feels that the "working classes" are alone fit to rule, he should have spoken so extravagantly as he did of what he termed "the class engaged in exploiting and profiteering." That, at any rate, is not the class the capitalist represents in this country, and when Mr. Purcell said, as reported, in general terms, "they have been known to jeer and laugh at the ignorance, the poverty and misery of their victims," he should at least have specified the persons he said he had known to be guilty of such extraordinary conduct. It is the custom of Labour leaders to speak as though labour alone considered anyone but themselves, but a year like the present marked by strikes, authorised and unauthorised, hardly supports their contention.

Mr. Purcell is reported to have expressed his views as follows: "It is our task to capture every legislative and administrative position, leaving what we do not want and have no use for to the other parties." This may be a wholly justifiable ambition but it hardly savours of that vision of true democracy that has been portrayed to the nation since the war.

In industrial matters Mr. Purcell had little to say. He welcomed the recent report on the building industry as an historical industrial document, "taking stock of the needs and requirements of the community and forming a complete census of the capacity of the building industry with a practical and workmanlike survey of the changes in organisation, equipment, and power needed to get the required results," and he recommends a "similar stock-taking in relation to other industries."

Again, on unemployment the President had no suggestion to make. He said unemployment pay was no cure, and is reported as having said, "Relief work, digging holes and filling them in again, is no remedy; emigration offers no way out; additional training in other industries and every such method will not cut out this cancer in our social system." What is the remedy, then? Mr. Purcell replies, "Our great and glorious task is to deal with the problem of poverty at its roots, and to solve it by bringing about a more equitable distribution of the wealth produced by the labour of our class." Again, we are offered the same panacea as before, but when that wealth is thus distributed what is to become of it? If it is used profitably it will again become capital and the world will go on as before; but if it is spent upon luxuries and pleasure, or in any way unproductively, then the very means relied upon at present by the class Mr. Purcell is speaking for, now being spent upon remedial legislation, will have been dissipated and other sources of assistance save universal taxation will have been removed. This is a point so often ignored by the school Mr. Purcell represents, but it cannot for ever escape their attention and should be carefully considered by them. Taxation supports building schemes and unemployment and countless other undertakings, but the bulk of the taxation is paid by the capitalist, and in his absence these projects and others such as the minimum wage will depend upon two considerations—increased production by labour, involving increased hours and a less high standard of living, or increased taxation on labour, which will savour of the policy of making them replace much of the wages they earn.

Capital to this country has become like the air we breathe and escapes the attention of those who are modelling the industrial system, their lungs filled with this unthought-about element. Remove that element and an entire change must come over all industrial conditions. The means of relieving unemployment must be not the distribution of existing wealth, but the creation of new wealth, and that is the real problem to be solved.

The proceedings on industrial matters appear to have taken a second place, and at any rate are very briefly reported. Perhaps the most important resolution carried was one which, framed on similar lines, had been rejected at the Congresses of the past two years, which would compel the trade unions to keep the General Council informed in all disputes. The Council would then not intervene without request, unless there appeared no prospect of a settlement, in which case it would intervene and report to Congress if the unions refused its assistance and advice. If invited to intervene the Council would organise all "moral and material support" on behalf of the unions. This resolution was carried on a card vote of 3,608,000 in favour and only 259,000 against it.

The resolution next in importance was that relating to what is now termed the "Industrial Workers' Charter," which was carried unanimously. Much of this charter is what used to be the formal resolution moved year after year at all Congresses calling for the nationalisation of the land, mines, minerals and railways; but at various Congresses and at the present meeting it has gradually expanded and now embodies the extension of State and municipal enterprise for the provision of social necessities and services, participation of the workers in the control of industry and its management, a 44-hour week, a legal minimum wage, provision of adequate maintenance for the unemployed with training centres for juveniles and adults, proper and adequate housing accommodation for the people, full educational facilities provided by the State from the elementary schools to the universities, adequate maintenance and compensation in respect of industrial accidents and diseases, State pensions for all at the age of 60, and pensions for widowed mothers and dependent children. The resolution also pledged the Congress to a vigorous campaign throughout the country in support of the objects of the "charter." The remedial legislation upon which we pride ourselves as a nation pales before this "charter." It ignores the Workmen's Compensation Acts, the Old Age Pension Acts, the Unemployment Insurance Acts, and the National Insurance Act, and calls for State aid in every possible relationship and condition. The present Government is already alive to the difficulties attending a minimum wage, for it involves in many industries either a subsidy or protection, and any Government which is in power soon gets to know that "State aid," coupled with capital levies, or the abolition of capital, must mean in the long run nothing more nor less than taxing the worker to maintain himself.

This "charter" leaves nothing for a man to do on his own behalf, but from 18 to 60 to live in a subsidised house and supply himself with food, if he works in strictly limited hours at an occupation of his own selection, and then to look to the State for all beside. Mr. Pollitt, criticising the Government on their conduct in the building dispute, is reported as having said, "Unless the Government are prepared to use the whole resources of the State solely in the interest of our class there will be a strong possibility of their being a Labour Government no longer after the next election." These ideas are not Mr. Pollitt's alone, for all the resolutions have the same savour that Government and the State must to a great extent maintain the workers. We are constantly told that it is the younger members of the trade unionists who "get bitten" with these doctrines, and it seems only right to warn those younger members that such a policy will bear most heavily on themselves. They are the sons of fathers who have lived under the old traditions, who have worked to maintain themselves a families, and in many cases by caref have started their sons on a higher p that on which they themselves ent No State can maintain its populati State funds alone. A time comes when must be oppressive, or labour must and it is not entering into the region to point out this fact to the younger who may live to experience the involved by what, when it is only may appear attractive. The fact nation can only in the long run be m by productive trade has a bearing on less drastic and comprehensive th incorporated in the "Industrial Charter," as it arises in relation to minimum wage and the fixing of wage what the value of the work produced but an arbitrary standard of living. A but unproductive wage can only be m temporarily, and a standard of living be raised by increased exertion or productivity or output. A subsi State-aided wage where it exceeds of the work produced becomes at onc upon the resources of the State, and a of living may exceed the amount tha provided by the exertions of the wag The standard of living, therefore, if to be regulated in regard to that, confined to reasonable necessities, attainment of luxuries and amuseme be left to the extra exertion of the The Industrial Workers' Charter do with an incentive to the individual to his own condition, and a too high sta living if it be taken as the unit on whi are fixed may have the same effect.

There is little in the proceedings as that calls for comment in our pages, note that a resolution was referred General Council suggesting an amen the Workmen's Compensation Acts, a report has not at present been given hope to notice this subject as soon as is available.

BUILDINGS MATERI COMMITTEE

BEFORE Parliament adjourned the Go accepted a motion in the House of Lor inquiry into the various alternative m house building, and the Minister of H accordingly set up a Committee with t ing terms of reference:—

"To inquire and report as to new or methods of construction which are o available for the building of houses working classes and to make recomm as to the organisation required for see adoption and use of approved new ma methods by local authorities and oth or persons providing such houses."

The Committee will be constituted as Sir Ernest W. Moir, Bart. (Chairm Frank Baines, Sir Charles T. Ruthe Harry Barnes, Mr. John A. Brodie Coppock, Mr. E. R. Forber, Mr. G. H H. J. C. Johnston, Lt.-Col. Cecil P Mr. W. H. Nicholls, Mr. A. G. White, Whyte, Mr. J. Wilson.

The Secretary of the Committee w T. H. Sheepshanks, of the Ministry o Whitehall, S.W.1, to whom all commu should be addressed.

Newcastle-Gateshead Bridge.

At a meeting in Newcastle recently Mayor of Newcastle intimated that a had been received stating that the Go would grant 65 per cent. towards the new high level bridge between New Gateshead, the total cost of which is at £970,000.

RS OF LABOUR IN UILDING INDUSTRY

putes Committee of the National ding Trades Employers have issued ng reply to a statement that "the e employers who threatened to lock peratives who refused to work more urs was in direct violation of the e settlement." :—

3 of the terms of settlement of reads as follows :—

f Labour.—That the working hours alt with forthwith as outlined in ued on June 16, 1924 (a copy of pended hereto). But in any event in those localities that have agreed hours by mutual consent under the e Constitution) the summer working be 46½ per week as and from the ent of official summer time, 1925. of June 16 referred to above reads and was jointly issued by the and Operatives' National Secretaries. cessary that the disagreements with e summer working hours should be thout further delay. The Joint Committee, therefore, requests that are differences still outstanding the yers and operatives meet within to consider same. Failing agree- e 1 of the National Working Rule as to summer hours shall become

lowing, therefore, sums up the posi- National Agreement confirming the rd provides that 46½ hours per week ked in summer time. One variation ved, *i.e.*, if employers and operatives or area mutually agree to maintain rs week they may do so. If not, bly 46½ hours is the standard ek. We cannot too strongly insist ave thus been two opportunities for ifficulty to be adjusted, *i.e.*, at the and of August. Nothing, therefore, tify a refusal to operate the exact f the Agreement."

thern Polytechnic Institute.

pectus of the Northern Polytechnic epartment of Architecture, Survey- ding), Holloway, London, N.7, has sued for the session 1924–5. The cial lectures have been arranged :— tober 6, "L.C.C. Housing," Mr. G. rest; October 27, "The Preserva- nt Monuments and Historic Build- ank Baines; November 20, "Tem- ldings," Mr. Percy C. Culver; "Town Planning and Development struction of the Devastated Areas," . L. Cart de Lafontaine. nuary 22, "Experimental Science ," Dr. R. E. Stradling; February estminster," Mr. Herbert A. Cox; The Development of Carpentry in Mr. Martin S. Briggs; March 30, Building Construction," Mr. T. P.

Wollaton Hall.

n Corporation has decided to buy ll (the seat of Lord Middleton) and 300 acres for £200,000. In view of the National Housing Association to erect 4,000 houses on the land, kly rental of 10s. or to become the ne tenant in 21 years at a rental of week. The houses would each entrance hall, parlour, large living- room, three bedrooms, bathroom th 600 yards of land to each house. Mr. A. Middleton the return to es would be £60,000 per annum.

*For rates of wages in the Building Trade in Scotland, see page 421.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

DOMESTIC SANITATIO

THE title given to this publication* in form of the author's lectures upon "San Science" does not fully evidence the sco the work, as, in addition to dealing with materials, fittings, construction, and testi house drains and all the necessary appurten both below and above ground, it also inc chapters upon rainfall, climate and geo institution and school sanitation, refuse tructors and appliances, lighting, warmin ventilation. The chapters upon "Dra Materials and Fittings" and "Water C and Slop Sinks" are particularly lucid, an pros and cons for the use of certain fittin well reasoned out. Conservancy system explained in detail in a manner that w readily understood by students.

The space allotted to "House Planning so very cramped that we consider a g service would have been derived by dev the whole section to the planning of "A ments Containing Sanitary Fittings," espe as the plans illustrated are not examples o planning and sound construction. We a opinion that authors dealing with s sections of architectural and building would be well advised to confer with an arc before publishing plans and construc details, in order to avoid discrepancies whi apt to be misleading to general students. are numerous illustrations throughou book, but many of these would have ga usefulness to students had they been dimensioned.

The last and, withal, shortest chapter sanitary surveys, and forms a logical, alt much abbreviated conclusion. Througho work there is the all-important ring of pr experience. Students who have at lectures delivered by the author will undou find this book very helpful in refreshin memories, and it will also be appreciat others who desire a small and concise book on the subject.

We consider, however, that before th edition, the chapters upon "Planning D Systems" and "Sanitary Building Co tion" in particular, might be revise advantage, and that the value of thi would be greatly increased by the addi chapters dealing with "Septic Tanks an Beds," "Rain Water Storage Ch (Brick and Concrete)," "Garage Dra "New Materials used for Rain-water "Gutters." &c.

BOSTON.—Approval has been given by the M.H. to the borrowing by the R.D.C. of £9,000 for the erection of 22 additional houses.

BRADFORD.—The M.T. has sanctioned a loan of £14,589 for the reconstruction of the tramway track in Halifax-road. The Electricity Commissioners have sanctioned loans of £150,000 for mains and services, and £20,000 for a sub-station. The T.C. has accepted an offer by Messrs. Franklands, Ltd., to bear the cost to the extent of £3,000 of the construction by the Corporation of a drainage outlet from the company's premises to the public sewer in Thornton-road. The M.H. has sanctioned a loan of £6,300 for works of sewerage. The T.C. proposes to arrange with the West Riding Land Co., Ltd., for the reservation of 156 acres at Wyke and Shelf as an open space under the town-planning scheme. The City Engineer is to demolish premises in Thornton-lane and erect three lock-up shops at a cost of £740. Estate development schemes as follows have been sanctioned: Coniston-grove for Mr. C. Dennison: Hayworth-road for Mr. J. Gray; North-road, Wisbey, for Mr. A. E. Akeroid; Stoney-lane for Eccleshill Workmen's Club; Lister-avenue for Mr. S. Webster; Mayo-avenue for Mr. T. Hoare; Wyke-lane for Mr. J. Sharpe; Toller-lane for Mr. W. Rawnsley; Norman-avenue for Mr. J. H. Smith, Wheatlands-crescent. The E.C. is considering a request for the establishment of day classes in connection with ceiling plaster decorative and figure work, the estimated cost, including the provision of hutment, being £865.

BRILLINGTON.—Plans passed by R.D.C.: Bungalow at Barff Farm, Hunmanby, for Mr. C. Nicholls; bungalow at Sewerby, for Mr. J. T. Martlock.

BRISTOL.—Carlton House is to be adapted at a cost of £695 as a remand home. The purchase of eight acres at Bedminster Down for £1,000 for allotments is recommended.

BURLEY-IN-WHARFEDALE.—The Council has approved of a scheme for the erection of 20 houses of the non-parlour type, at an estimated cost of £545 per house. Application is being made to the M.H. for sanction to borrow £11,000 to cover the cost of erection, making of the roads, sewers and other items.

BURNLEY.—The Corporation had agreed to purchase 50 acres of land not built upon at the Palace House site for £8,000. The T.C. have been recommended to purchase land for widening Todmorden road near Hand Bridge for £1,560. Proposals have been made in regard to the War Memorial for the erection of a monument in Towneley Park. A design and scheme estimated to cost £5,000 has been submitted to the T.C. For the layout of the land adjoining the Memorial to be undertaken by the Corporation, the B.S. estimates the cost at £700. The Improvements Committee are to submit a scheme for the construction of a new bridge in Yorkshire-street and the widening of the bridge near the Parish Church. The Housing Committee are asked to consider the possibility of proceeding with the Finney Gate clearance scheme and the B.S. was instructed to report on the proposed new arterial road from Padiham road to Colne road.

BURTON-ON-TRENT.—The T.C. is applying for sanction for the erection of houses on the Wellington-street site.

BURY.—The War Memorial Committee have decided to erect the Central War Memorial in a corner of the Parish Churchyard.

BUXTON.—At its next meeting the T.C. is to discuss the provision of a swimming bath at a cost of £12,000, exclusive of site.

CARLISLE.—The T.C. is purchasing property in Milbourne-street, required for the widening of Caldew Bridge. Plans passed: Grand stand, Warwick-road, for Mr. H. E. Scarborough, architect, for Carlisle Rugby Football Club; new out-patients' department, Cumberland Infirmary, for Mr. S. W. Black, architect; four houses, Blackwell-road, for Mr. A. Heedless.

CARMARTHENSHIRE.—The reconstruction of Carmarthen Town Bridge, at an estimated cost of £45,000, with incidental road work, is to be undertaken by the C.C., the Carmarthen T.C. and the G.W.R. Co. Grant of 65 per cent. of cost is promised; the Ammanford U.D.C. is to undertake private street works; the County E.C. is to erect a new school at Penybank.

CASTLEFORD.—Plans have been prepared for the erection of a proposed cottage hospital at Hightown, for the Castleford, Normanton, and District Cottage Hospital Committee. The architect is Mr. R. A. Eastdale of Castleford, and tenders are being invited.

CHADDERTON.—The Lancashire E.C. is conferring with the local authorities regarding a proposal for a new secondary school.

CHESTER-LE-STREET.—The R.D.C. has resolved to apply for sanction to build an additional 20 houses at Edmondsley.—Grants are to be sought from the Unemployment Committee in respect to the following works, for which loans of £50,260 will be necessary Fatfield-road widening, Portobello-road widening, Birtley–Ouston-road widening, proposed new road from Lumley Second Pit to Houghton Gate; proposed new road between New Lambton and Gill-crescent; road protection at Riverside-road, Fatfield; and proposed new road at Birtley–Blackfell.

CLAYTON-LE-MOORS.—A scheme is to be undertaken by the Council for the sewering from Sparth-road to Hyndburn Bridge.

CLOUGHTON (E. YORKS).—The Adult School Guest House Association propose to erect nine houses at an estimated cost of £500 per house.

CROMPTON.—A scheme is to be prepared by the Housing Committee of the D.C. for the erection of 18 to 25 houses on a site acquired for £300 between Frazer-street and Glebe-street. A sub-committee has been formed to negotiate the purchase of land at Scowcroft, adjoining land now belonging to the Council, for extension of the existing housing site.

DARLINGTON.—Plans passed by the T.C.: Church Hall and Sunday School, at Elmfield-terrace; house, Leafield-road, F. Clark & Son; two bungalows, Yarm-road, T. Boyd; lay-out of new streets, Cleveland-avenue. F. Clark & Son.

DEWSBURY.—Plans passed: Baker's store at Huddersfield-road for Mr. H. Almond; conversion of club premises into houses at Moor End-lane for Messrs. J. Tattersfield & Son; reconstruction of the Wesleyan Centenary Sunday School, Wellington-road; house at Wakefield-road for Mr. J. Hamer; sports pavilion at Oxford-road for Mr. H. Cullingworth; and two houses at Wakefield-road for Messrs. S. Booth and H. Holdsworth.

DEVONPORT.—A new Catholic school for girls to be built will cost £3,000.

DONEGAL.—The water supply scheme for Ballybofey and Stranorlar is to cost £16,790.

DUDLEY.—The T.C. has appointed Mr. W. Quance, of Smethwick, as deputy housing director and architectural assistant. It is proposed to purchase 18 acres at Netherton from the Earl of Dudley at the price of £4,000 for a housing site. The surface water sewer from Wolverton-road to Birmingham-road bridge is to be relaid. For relief of unemployment, schemes have been prepared for the reconstruction of the road from Grazebrook Crossing to Nertherton at a cost of £24,000, and further levelling of the Woodside housing site at a cost of £2,000.—Plans passed by T.C.: Mrs. R. Musty, conversion of warehouse into two lock-up shops, Dixon's Green; Mr. C. H. Lloyd, two houses, Dixon's Green, Dudley; Messrs. Bournehills Colliery and Fire Clay Co., conversion of offices into house, Darby End, Netherton, Dudley; Messrs. J. Hanson & Sons, rebuilding the Three Crowns Inn at corner of High-street and Stafford-street; Raybould, Whitehouse & Co., Ltd., new warehouse, Wellington-road.

DUKINFIELD.—The Surveyor has been instructed to prepare a scheme for the reconstruction of Sandy-lane.

GATESHEAD.—The T.C. has decided, in view of the M.H.'s refusal to sanction a larger sum, to make application for sanction to borrow £50,000 for the erection of 100 houses on the Carr Hill Estate.

GLAMORGANSHIRE.—The Glamorgan Main Roads Committee stated that the Western Section Committee was to collaborate with the Neath R.D.C. in diverting the main road at Briton Ferry so as to cross the Neath River and join the road at Jersey Marine.—The Abercrave and District Miners' Welfare Association is to erect a central workmen's hall, to seat 800, and estimated to cost about £5,000. Grant of £1,000 has already been made from the Central Fund and a freehold site has been procured.

GLOSSOP.—The further widening of Newshaw-lane is proposed. A paddling pool is to be provided alongside Glossop brook, with necessary fencing and walling. A loan of £13,900 has been obtained for water supply and sewerage. A committee is considering the provision of slipper baths in the centre of the town. Various repair works are to be carried out at Wood's Hospital. The Council has passed plans prepared by the Borough Surveyor for a meter house at Swineshaw reservoir.

GOLBORNE.—It is expected that in the near future efforts will be made to inaugurate a scheme for a new church for All Saints.

GREAT HAYWOOD.—Plans for the extension of St. John's Schools by the provision of an extra classroom and a cloak room have been approved by the Stafford E.C.

HAMPTON HILL.—The congregation of the Sacred Heart and St. Mary's Magdalene are raising funds for the erection of a permanent church on a site they have acquired.

HAZEL GROVE.—Funds are being raised by the parishioners of the Norbury Parish Church to defray the cost of the erecting a new chancel, etc.

HEMEL HEMPSTEAD.—Planns passed by R.D.C.: Bungalow at Scatterdell-lane, Chipperfield, for Mr. Roberts; bungalow at Scatterdell-lane, Chipperfield, for Mr. Shillabeer.

HETTON.—The U.D.C. has obtained sanction from the M.H. for the erection of an additional 36 houses on the Hetton-road site.

HORBURY.—Plans passed: House in Regent-street for Mr. H. Benn; bungalow off Regent-street for Mr. W. G. Chamberlain; house off Regent-street for Mrs. Felton; and two houses off Regent-street for Miss Felton and Mr. J. W. Rigg.

HORSFORTH.—Plans passed by U.D.C.: Lay-out plan of Green Emmett Estate; house and shop for Mr. J. W. Pass; pair of houses at Outwood-lane for Mr. J. Cryer; pair of houses in Victoria-drive for Mr. J. B. Lee; pair of houses in Stanhope-drive for Messrs. W. Ratcliffe & Co.

JARROW.—An inquiry has been held into the application of the T.C. to borrow £13,350 for carrying out a portion of the scheme for conversion to water carriage of sewerage in the borough.

KIRKHAM.—Plans have been approved by the Fylde R.D.C. for the erection of eight houses. The Council have agreed to make up a length of road from the borough boundary to Elaine-avenue.

LANARKSHIRE.—The E.C. has decided to purchase property in Mitchell-street, Glasgow, for the purposes of conversion into Central Education Offices. The reconstruction work is estimated to cost £18,860.

LANCHESTER.—A proposal is on foot for the erection of a large new central hospital for the area covered by the Lanchester Joint Hospital Board.

LEEDS.—The Watch Committee has passed plans for alterations at the Sheepscar Police Station, to cost £380. The M.H. has sanctioned the scheme for the adaptation of premises in Alexander-street for art gallery and library purposes, at a cost of £4,700. The T.C. is to borrow £19,000 for the construction of a section of the Ring-road from Tongue-lane to Smithy Mills-lane, including the provision of a surface water sewer. Sanction is to be sought for a loan of £24,000 or the purchase of land required in connection with the construction of the Middleton light railway and for a highways depot. Relief schemes proposed include a sewer in Stanningley-road, and the widening of Middleton-road. The M.H. has sanctioned a loan of £2,436 for the construction of a ladies' convenience at Roundhay Park. The M.H. has sanctioned the purchase of Chapeltown barracks at a cost of £12,120. A new road is proposed from Roundhay-road to Chapeltown-road through the barracks site. A substation is to be erected at Old-lane in connection with the power supply for the Middleton light railway. The Health Committee is to seek an alternative site for a sanatorium. The Sewerage Engineer has reported that Mr. D. Davidson has carried out his agreement for the preparation of drawings and specifications in connection with his system of reinforced concrete for cylinder foundations and floors at the low level tanks at Knostrop. A sewer is to be constructed, at a cost of £700, for property at Armley Heights and Lower Heights. Plans have been prepared for a golf course at Meanwood. Plans have been passed for the lay-out of the Kirkstall Estate by Messrs. Hill & Sons. It is proposed to widen Whitehall-road, Farnley, to 100 ft. Land is to be scheduled in the Gledhow Valley town planned area for open spaces. Land at Beeston is to be acquired for a recreation ground. Land is to be purchased in Roman-avenue for street improvements. The City Engineer has been authorised to report as to additional sites for housing purposes. The City Engineer has prepared plans in connection with the extension of the art gallery into the premises acquired from Edmondson's Warehouse, Ltd. Tenders are also to be obtained for the following works at the Meanwood-road Baths: Relining and making watertight large swimming bath.

LEVENSHULME.—Funds are being raised for the enlargement of St. Peter's School.

LLANELLY.—The Carnegie Trust has agreed to the B.C.'s proposal that the library to be erected shall be a joint building with the proposed new Council swimming baths.

LUTON.—The M.T. has decided to make a grant towards the road works in connection with the George-street widening. The B.S. has prepared further plans for an improvement in Dunstable-road, to cost £450.—Plans passed by T.C.: A. Catlin, four houses, Biscot-road; F. C. Lane, eight garages, South-road; N. Hill, four houses, Lincoln-road; C. Timpson, two houses, Stratford-road; R. V. How, four houses, Holland & Cavendish-roads; J. Tomkins & Sons, four houses, Colin-road.

MALDEN (SURREY).—The Surveyor has submitted to the U.D.C. plans of the proposed war memorial and lay-out of the site in front of the Council Offices. The Council proposes to undertake the preparation of the site at a cost of £137. A loan of £4,641 has been sanctioned for street improvement works in Kingston-road. The Council is to confer with Messrs. Woodruffes on behalf of the Gower Estate, and Mr. S. E. Parkes, Motspur Estate, in regard to certain objections to the town-planning proposals. The Council is to seek sanction to include eight houses at Idiston-square, for Messrs. Leather & Sons. The Surveyor is to report on the cost of providing recreative facilities at the Kingston-road Recreation Ground. —Plans passed: House, Coombe-lane, for Mr. J. A. Hunt; house, George-road, for Mr. H. Bailey; house, Presburg-road, for Mr. R. Lewis; house, Traps-lane, for Mr. H. Bailey; house, Idminston-road, for Messrs. A. F. & J. Leather; four houses, Selwyn-road, for Mr. E. Hayes; four houses, Chestnut-road, for Mr. A. Thomas; five houses, Connaught-road, for Messrs. H. F. White & Son; house, King's-avenue, for Mr. A. Windsor; house, Blakes-lane, for Modern Homes, Ltd.; six houses, Malden-gardens, for Mr. F. C. Stredder; house, Westbury-road, for Mr. F. C. Stredder; house, Lynton-road, for Mr. J. Atkins; three houses, Malden Hill, for Mr. J. H. Palmer; house, Blakes-lane, for Messrs. Parkes & Co.; house, Coombe Hill-road, for Messrs. OBITUARY

took place recently of Mr. Walter ing Director and founder of Messrs. rood, Ltd. Mr. Jones was born in ceeded to the business on the death

The inventor of many improve- hot-water heating industry, Mr. ll known for his public and com- ties. In 1899 he was President of on of Heating and Ventilating d in the following year was elected e Institution of Mechanical Engi- as the author of many pamphlets subjects, and under his guidance ood's developed an entirely new reatment of sewage under the title Sludge."

as occurred of Mr. Thomas Taylor, and contractor, of Holly House, Pontypridd. The late Mr. Taylor he biggest figures in contractors' n Wales. For many years he was d at one time chairman, of the D.C.

THE SCOTTISH BUILDER

SCOTTISH SANITARY INSTITUTE

At the jubilee Congress of the Incorporated Sanitary Association of Scotland, held recently at Aberdeen, the following resolutions were re-affirmed by the meeting. The first expressed approval of the movement for the training, examination, and national registration of certified plumbers as calculated to secure the efficiency of the sanitary arrangements of dwellings, and so promote the public health and safety of property. The second reaffirmed a resolution passed last year, that the Bill of Lord Novar in relation to smoke pollution should be amended in terms of the recommendations of the Departmental Committee appointed by the Minister of Health.

Lord Lister Memorial.

The statue of Lord Lister which has recently been erected in Kelvingrove Park, Glasgow, will be unveiled on September 17. The statue was cast from the work of Mr. G. H. Paulin, A.R.S.A., by Messrs. M'Donald & Creswick, Ltd., bronze-founders, Edinburgh.

NEW BUILDINGS IN SCOTLAND

Paisley.—Houses.—The T.C. has acquired a large tract of ground at Bartenholm for the erection of 42 houses.

Govan.—Houses.—The Glasgow Corporation proposes to build some experimental houses on ground at Langlands.

Dunfermline.—Post Office.—The postal authorities have acquired from the Dunfermline Palace Kinema, Ltd., ground at the rear of the office, in order to provide further post office accommodation. The purchase price was £1,200.

Aberdeen.—Shed.—The Burgh Surveyor has received instructions from the Tramways Committee to obtain tenders for the erection of a shed in King-street to accommodate 24 cars. The Burgh Surveyor's estimate is £13,800.

Auchinleck.—Cottage.—At a meeting of the County Road Board the Ayr District Committee was instructed to spend £550 for the purpose of erecting a roadman's cottage at Auchinleck.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Brick-layers' Labourers.	Plas-terers' Labourers.
Aberdeen	1/8	1/8½	1/8	1/8	1/8	1/8	1/6	1/0¼

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VII.—No. 4259. SEPTEMBER 19 1924.

BRITISH INSTITUTE OF INDUSTRIAL ART

THE establishment of a small permanent exhibition in the North Court Annex of the Victoria and Albert Museum by this Institute inaugurates a further step in the development of its work. The British Institute was incorporated in 1920, under the es of the Board of Education and the Board of Trade, he object of promoting closer relationship between art dustry. This object, which is a variation of one more ic with which it started, that of improving the standard ish craftsmanship, no doubt includes the same hope, tablishes it on a more practical basis. It is associated ims with the Design and Industries Association and the Arts Association, embracing among its Fellows and tes many artists and craftsmen.

Institute has held exhibitions at the Museum from time over the last few years, and they receive an nce both from the fact of the exhibitions being held National Museum and under Government auspices. These ions in calling attention to the importance of art in y, of the value of sound methods in production, inter- t a time when it is of national importance to pay n to these things. Its existence argues in the most way the need of improvement, for if there were nothing with industry there would be no need for such an ion. Moreover, it serves a very useful purpose in g those barriers between industrial production and art re so unnatural and misleading, and which have led gard art as something outside of life when, as a matter there can be no healthy national life without the union wain. Beauty emerges as the natural outcome of work e. It is not art that is far from us, but ourselves who rom art, inasmuch as it does not penetrate our industries, meate our life. But a movement such as this has to facts of the situation and recognise the difficulties its work. A conflict has existed between industry and they have been through such misunderstanding nce with each other. It existed because, as the result dustrial revolution, the methods of trade seemed wholly to art and the artist directed his labours elsewhere. w better understood that industry directed only by and economic considerations tends to deteriorate relationships no less than the quality of industrial . It has consequently fostered the unrest and dis- that menace Western civilisation to-day, and taking the s out of his work the workman tends to turn his ness against society. The importance of art to industry e understood on the economical implication of such only, but by recognising that beneath these lies the eed to create a content for the worker and restore that what he produces, which would fill his mind to the of too great dependence on political change. For n the work of this Institute is to be welcomed, because lence of the recognition by the State of the necessity ser relation between art and industry, and of the ring in an unconverted industrialism. In our trouble towards art as that endowment which unites life in industry. When we controlled the markets of the thout the competition which now exists to so much extent, we were tempted to make quantity our aim, fits became the leading motive. Now that other the East as well as the Occident, have largely owing come able to produce for themselves, our position onger on this supremacy of supply to the same extent, the quality of our industries which will tell. And it he quality of our manufactures shall now be such set a standard for the rest of the world that will present markets, and encourage the creation of new us.

g to the exhibition itself, we need not complain of the haracter of its beginning, for there is real charm tle show. It is not representative in any national her what is seen is a small collection of the work of a group of artists and craftsmen round which it has hitherto moved. It will be a very difficult task to draw in sufficient fresh blood to make it more than what it is at present—an exhibition of the work of certain craftsmen and artists—and we feel that the recurrence so often of the names of the same artists is a source of weakness rather than strength. But it should be understood in justice to the aim of this Institute that the present exhibition is not in itself permanent, but a nucleus formed from which to start. The work exhibited will be replaced by other work, and therefore there will always be movement and variety, the work being shown in rotation.

The exhibits include textiles, pottery, printing, silver and goldsmiths' work, illustration, modelling, bookbinding and other crafts, many of the examples being of considerable excellence.

It is perhaps unlucky that the British Institute of Industrial Art has been inaugurated at a time when there is a tendency to distrust organisations to promote art—the belief being that the tendency of organisation is to promote the average rather than the best; but this should not prevent us from recognising that there is a real place for such an Institute if it keeps this danger fully in mind and therefore avoids the pitfalls in its way. If it recognises the dangers it will preserve its independence from groups or special interests which may endeavour to make use of it. Its privileged situation in the Victoria and Albert Museum confers a prestige on what is shown there, and this might create ill-feeling unless care is taken to preserve its own aims. It is no doubt very difficult to draw the line as to what is entitled to exhibition, either at one end or the other. If it is seen to yield to the pressure of firms or individuals anxious to secure the *éclat* of such exhibition for their work it will lose the adherence of the better kind of craftsman and create division under which it will disappear. We believe that this is recognised by the authorities of the Institute, and therefore we are justified in hoping that it will go forward in the development of its aim of promoting closer relationship between art and industry.

It is a welcome fact that the manufacturer is now much more ready to recognise the assistance he can obtain from the artist, and though our retail shops reveal how much there is to be learnt—how much still to be unlearnt—in regard to what is fit and becoming in design, form and treatment, he is readier now to seek aid, an aid which the Institute is well enabled to supply for him. For the education of the manufacturer is no less necessary on the side of art than on that of science, and he has in the past pursued the one to the neglect of the other. The better knowledge of the craftsman in the methods of the manufacturer is no less required. The Institute will help to bring them together and we already see approximation towards this better state of things.

The mistaken aim of novelty for its own sake, the desire to dazzle and catch the eye of the customer has led to extravagance of form, over-ornamentation and the strident effects of flamboyant pattern; but we have only to look at examples of textiles or pottery, as shown at this exhibition, to see that through the ordinary channels of manufacture a better standard is being introduced.

On the whole we are inclined to be hopeful that the British Institute of Industrial Art, which now that it is no longer aided by a Government grant rests on public appreciation of its usefulness for support, will secure the support to which its aims entitle it. Manufacturers have been supporting the movement, and have been ready to keep it going, and we hope that this support may be continued to its work, for the benefit to our industries may be considerable.

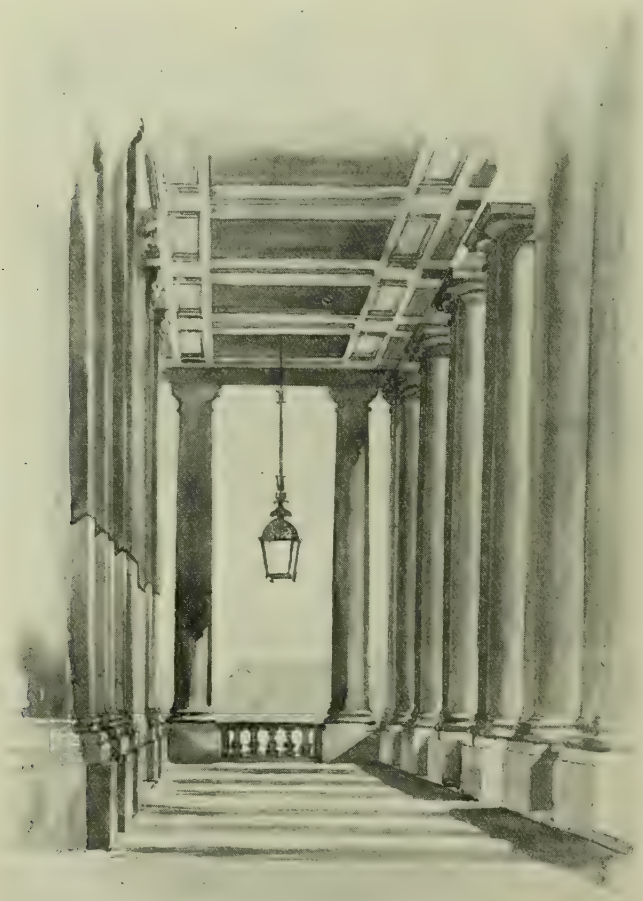
But nothing is effected of much service to the nation without some sacrifice. It is not enough that we should seek economic advantage in improvements because we see a further means of profit in making use of art. The good must be sought for its own sake because the claims of our common nature no less than our obligation as citizens directs us to have an ideal for our work as part of our love of country and of its good example to the world.

NOTES.

London Traffic and the River.

ONE of the finest things London can boast of is the flowing of the Thames through its midst. Even as it is now, with all the drawbacks of ugly buildings and bridges, the river forms the centre of fine views such as few cities in the world can show. The possibilities of riverside development and beautiful bridges are so great that were they made into realities no city could compare with London for the beauty and dignity of its central area. Yet this great asset in the amenity of a great city is being constantly assailed and it is not unlikely that it will some day be very seriously impaired. We have been treated to all sorts of suggestions for destroying or impeding the fine perspective of the river by viaducts, bridges and railways. It has been suggested that a viaduct might traverse its length and it is proposed that the winding of the river might be entirely done away with by a straight-cut canal on the south side and the river turned into a great roadway. We are not lacking in ingenuity, but we are sadly lacking in perspicuity. We may not be in imminent danger of seeing our fine river bed turned into a sunken roadway ; we may yet be saved the horrors of elevated railroads. We may escape this, that, and the other misfortune, but why cannot we insist on having some adequate controlling authority which will save London from its haphazard growth and with the best available wisdom direct its growth and development ?

The Palace of Avignon.

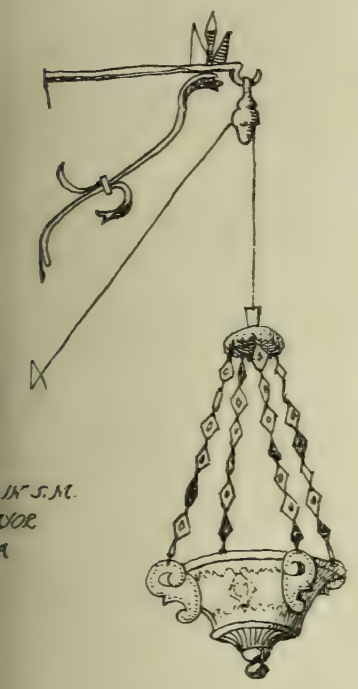


THIS great mediæval monument, which has been subject to so much neglect on one hand and vandalism on the other, is now occupying the attention of the French people, and there is a growing demand for its restoration. We are told that the noble Tour de la Garde-Robe, built by Clement VI in 1342–43, is giving way and leaning against the neighbouring Tour des Anges. When we come, however, to consider what should be done in the present circumstances we are at once up against the problem of what is possible or desirable. It is stated that the aim of the restorers "obviously ought to be to make the building as nearly as possible what it was in its period of glory"—and "common is the commonplace." What a fallacy lurks in such a statement, suggesting as it does that, in order to preserve its original character, we should blot it out still further. For this is what making the building as nearly as possible what it was inevitably means. When shall we recognise that to make a building what it was in the fourteenth century, we are in the twentieth, is whol possible? All we can do, so far as vation is concerned, is to rep reverently as possible what is p of repair, and if rebuilding is a quired for modern purposes, fran recognise that it replaces the ancien with modern work of its own cha Wren's Chapter House at Lincoln dral is very much more wholesom would have been any Gothic substitute.

Violletle-Duc.

VIOLLET-LE-DUC, in posing during his li the restoration of the of Avignon "to the in which it was left in 1376 by G XI," expressed a view which, in h time, he was able to enforce with fatal injury to those ancient bui in whose so-called restoration h concerned. We can hardly bring ou to believe, with the knowledge gained of what such restoration that the Palace of the Popes at A will now be left to suffer the same f

An Ealing Disfigurement.



THE provision for g safety in regard to traffic is not to b regarded, but surely, must have large refl mirrors at difficult street turnings, reasonable consideration for the l in which they are placed should a borne in mind in justice to thos have to endure them. There ha erected recently on the old gre Ealing a great hoarding, consist two large mirrors directed either above and below each of whi advertisement is prominently dis May we appeal against the use made of these mirrors also to int advertising into situations which at any rate be secure from them spot on which this particular abomi is erected has for background the ol sheltered green and "Walpole B built by Sir John Soane, now the Library. There is so little left from commercial defacement in the that we might have been spare further outrage. Ealing, owing to want of public spirit in the l suffers much defacement in its pro sites through the encroachments advertiser, and we should like local committees formed in pa districts to watch over the amenit bring pressure to bear in defence decencies of appearance that sho secured to our towns. Could Scapa Society help ?

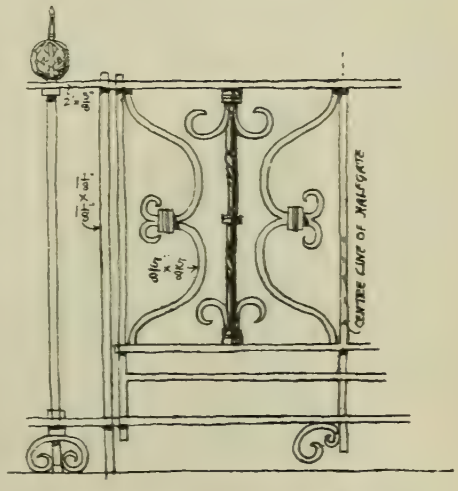
cen-
tion
rt.

THE account in a contemporary of the work of a small society of painters located in the country makes reference tendency of groups of artists to rural districts, and expresses the at it must not be mistaken for a of our native arts, &c., "which be brought about by any overhead , but can only proceed spontaneously from changes in the whole conduct of industry not likely to occur." But where, then, are changes to begin? May not such movements be the forerunners of change? In order to obtain the best crops for agriculture the seed is brought from a distance. The spinning industry of South Wales was begun by Protestant refugees. It was the Flemings who brought the woollen industry to Oxford and Gloucester. Was it not the Huguenots who started the silk industry in the Eastern counties? Why is it any more "overhead" to hope that the settlement of artists and craftsmen in rural districts would give a new impulse to art and life? It was the Spanish sailors wrecked from the Armada who taught the women of the Fair Isles to knit in coloured patterns. But not to multiply instances we may ask why revival should not be possible for the countryside through the new impulse brought by artists and craftsmen? With much in the account

HINGE & SCUTCHEON AT JEREZ.

to which we refer it is possible to find agreement, as when the writer states, "it is clearly to the advantage of any neighbourhood to have artists among its population and to enjoy opportunities of seeing their work; and on the other hand the artists themselves are likely to benefit by close contact with rural pursuits and the simpler kind of people."

The Mistake of Encouragement.



ANYTHING like organised encouragement of such a movement as this of the craftsman working in the country is opposed to its best prospects, and therefore likely to injure it; it is more likely to divert it from really wholesome growth and draw the shadow of dilettantism over it. It is much better that such a movement should be left to develop on itself, and the fatal tendency to form further societies avoided. The artist or craftsman settled in the rural districts is best left alone quietly to shape his own life and work, which prompt him to seek a greater freedom for his labours, a less artificial contact, simpler surroundings, and reduced expenditure, so directing his influence towards changes in the conduct of industry by the better example of his own work.

Friction in the Building Trade.

A PAST PRESIDENT of the National Federation of the Building Trades Employers asks some pertinent questions in the letter which appears on p. 429 this week. He asks why the trade should still be disturbed on the question of working hours during legal summer time, seeing that not only did Sir Hugh Fraser's award, which was agreed to by both sides, include a provision for 46½ hours per week, but the recent strike and lock-out settlement confirmed it. It cannot be said that 46½ hours per week during summer time are too long, and there is little doubt that a great many operatives are willing to accept such a week, and yet we find this question of hours constantly raised by a section of the operatives to whom the 44-hour week has become something of a fetish, and who seem to pay less attention to the substance than the shadow.

GENERAL NEWS

Professional Announcements.

Messrs. Ross & Briggs have removed to Eldon Chambers, 73, Manningham-lane, Bradford.

The Cambridge University School of Architecture has moved from 75, Trumpington-street to 1, Scroope-terrace, Cambridge (a little south of the Fitzwilliam Museum and beside the Engineering Laboratory). Mr. Theodore Fyfe's offices are now at 1, Scroope-terrace, telephone 237 Cambridge, as before.

Concrete Houses.

Leicester City Council recently accepted the tender of Messrs. Henry Boot, London, for building 1,500 concrete houses, at a cost of £735,000.

Instruction in Building.

The London County Council has recently issued a pamphlet (Privileges of Citizenship Series, No. 6), which gives details of the various centres at which building instruction can be obtained. Copies can be obtained from the Education Officer, The County Hall, Westminster Bridge, S.E. 1.

New Church, Abercarn.

A new church is being erected at Abercarn, at an approximate cost of £12,000. The edifice will consist of a nave and aisles 90 ft. long and 53 ft. wide, and will seat upwards of 600. There will be vestries to the south of the chancel, and a tower 60 ft. high is provided for. The architect is Mr. J. Coates-Carter, Prestbury, Glos.; and the contractor, Mr. W. Ewart Evans, Newport.

The Institution of Public Lighting Engineers.

The first annual meeting of the Institution of Public Lighting Engineers will take place at Glasgow on September 16 and 17. On the first day the President, Mr. Langlands, will give his presidential address, and the following papers will be read during the meeting: Mr. E. G. Stewart, "Street Lighting and Visibility"; Mr. R. B. Mitchell, "Electric Mains for Street Lighting." The subject of a paper by Mr. T. Hayden Harrison will be announced later.

Llanvaches Memorial.

Llanvaches Memorial Hall was recently opened by Sir Garrod Thomas, M.D. The memorial hall has been added to the existing chapel, which dates from 1639. Built at a cost of £750 to the designs of Mr. Frank S. Swash, F.R.I.B.A., Newport, it gives seating accommodation for about 1,200, and, in addition, there is a ministers' vestry, with access to the chapel, and a retiring room. The work was carried out by Mr. H. P. Huckson, Penhow.

University of Manchester.

The prospectus of University Courses in the Municipal College of Technology, Manchester, Session 1924–5, has just been issued. It gives particulars of courses in mechanical engineering, electrical engineering, sanitary engineering, applied chemistry, textile industries, printing and photographic technology, building, mining, mathematics and physics. The building section includes structural iron and steel work; masonry and concrete work; together with reinforced concrete and instruction in standard specifications and the reasons for their use.

City and Guilds of London Institute.

The programme of the City and Guilds of London Institute (Department of Technology) has just been issued for the session 1924–5. It gives particulars of some eighty subjects, including manufacture and technology of pigments, paints and varnishes; iron and steel manufacture; metallurgy of non-ferrous metals; electrical engineering; metal plate work; plumbing; mechanical engineering; carpentry and joinery; brickwork; masonry; plasterers' work; painters' and decorators' work; builders' quantities; and structural, heating and ventilating engineering.

The Technical College, Cardiff.

The prospectus of the Technical College, Cardiff (Department of Architecture and Civic Design), has just been issued for the session 1924–5. The Head of the Department is Mr. W. S. Purchon; lecturer, Mr. R. H. V
assistant lecturer, Mr. Lewis John. The e
examiner is Mr. Paul Waterhouse.

Students in the department of archi
attend courses of instruction in other
ments as follows: Drawing of orn

ON OF BUILDING TRADES EMPLOYERS.

"Atlantis."

Professor Lethaby's article on "Animal
om Asia to Central America and North
in your issue for August 29, comes
ely with the publication of Mr. Lewis
book, "The Problem of Atlantis."
erested in the subject will find in this
reat deal of relevant matter.
or Lethaby refers to Dr. S. G. Mosley,
can authority, as saying, "any attempt
ks to establish direct cultural connec-
tion between the Maya and any old-world civilisation is quite at variance with the results of modern research. And yet the superficial similarities are such as to win for this exploded hypothesis new adherents." Professor Lethaby's comment to this, that "it was just these 'superficial' similarities that independently convinced me that not only Indian and Chinese, but Hellenistic art also influenced the development of ancient American culture . . ." exactly bears out Mr. Spence's theory, the result of what must have been years of patient research by him, as every aspect of the subject is viewed most meticulously.

The "Log Letters of the *Challenger*" (1877 edition, Macmillan & Co.) contains a valuable chart of soundings of the mid-Atlantic bed, which go to prove that the lost continent of Atlantis was no myth. This chart closely follows the conjectural map of Atlantide made by Gattefossé.

Mr. Spence's passages relating to the architectural side of the problem are enlightening from the point of view of the history of building in ancient Central America, Hellenistic Greece, Egypt and Babylonia; particularly as he has been guided by facts and not romance which, until lately, seems to be coupled with the word "Atlantis."

A. ARCHER-BETHAM.

London.

[This fine old barn at Ablington is so admirable in its general proportion and effect that it is difficult to believe at first sight that it is not an old church with double transepts.]

Modern London.

SIR,—London is a wonderful town—in fact it is not only beautiful, but the envy of all nations—and yet while we casually walk its busy thoroughfares, feeling a sense of pride in the fact that we are British and that all London, end to end, belongs to us Britishers, we seldom if ever, allow our thoughts to seek out the master minds who have created for us this wonderful city.

In all, a city is created by the buildings which it possesses, without which the very constitution of a city is lost—in fact, a city is solely constituted of buildings large and small.

Do we, as we walk from Piccadilly-circus to Oxford-circus, ever turn our attention to the magnificent buildings which flank us right and left? We know they are there and we have a feeling that everything is very wonderful, but few of us take the trouble to stand for a few minutes and observe the architecture of new London and to seek out the architects who have so endowed the city with all this recently-acquired richness. The art of an architectural building is, if not greater, at least equal in beauty and refinement to its sister art at Burlington House. We would only too willingly take the trouble to spend a day, maybe a week, in Burlington House to admire the work of our great brush artists, which I will admit are worthy of the greatest admiration; yet why cannot we see and appreciate more sincerely the art that presents itself to us in practically every street and turning in London in the form of architecture?

In a building the good proportion of each component part, one to the other, the general massing of the larger features, the purity and the restraint in embellishment are all elements acquired from an artistic architectural master mind.

We do not all realise that architecture is perhaps the greatest art of our time; in fact, it constitutes our daily environment and has held its position in the realms of art from the days of early Greece; we have the rise of Greek architecture which developed into a style beyond criticism. We next have the Roman period, which took up the art of Greece and finally developed it in accordance with their own requirements that it completely l-st the purpose for which it was intended, and then we have a relapse only to be followed by the rise of the Byzantine style in the East. After this we have the dark ages, when the world struggled to create a new style, until we eventually arrived with Gothic, which culminated in our great mediæval cathedrals, of which practically every detail we can trace back to Rome.

Then we have a departure from vertical to horizontal again, which naturally arose in Italy, the seat of the old Roman Empire, under the control of Brunelleschi, which commenced the Renaissance style and reached a climax in this country under Sir Christopher Wren and Inigo Jones. Since that time we passed through many years of darkness and only now are we beginning to see a light upon architecture which promises to outshine the grandest period the world has known, and I think I do not suggest too much when I appeal to the public to try and observe the beauty around them with a little keener eye and develop an interest in architecture which I am sure is worthy of us all.

Hornsea. B. J. A. SMITH.

Studentship for Archaeology.

A two years' studentship of £250 per annum, for the purpose of archæological exploration in the Greek Islands has been awarded by the University of Oxford to Mr. Humphrey G. G. Payne, son of the late Mr. E. J. Payne, the archæologist.

SOME DETAILS OF SOUTH SPANISH ARCHITECTURE

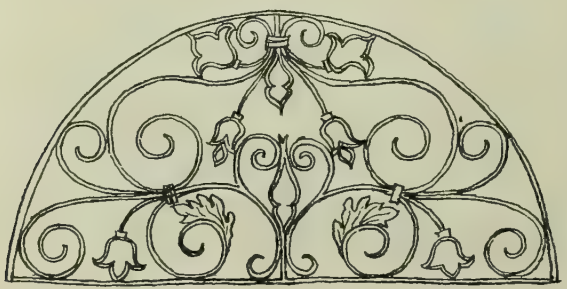
By P. M. STRATTON, A.R.I.B.A.

The function of these details is to form a contrast in their richness with the plain wall surface. In Spanish walls the voids are set far apart and in total superficies are much less than the solids. Wall, as plain wall and nothing else, is valued. In reaction, or to satisfy an opposite instinct, Spanish decorative work is almost wholly a matter of line, or of such opening out and intricate piercing of surface as to be a matter of linear effect. The lacework is an example; the combs and mantillas tell the same tale. The ironwork is a net of fancies; and there is hardly a building without ironwork, as in balconies, grilles or gates, or delicate escutcheons on massive doors. The balconies are of all ornaments the most characteristic; they are supported on iron brackets or occasionally on clumsy stone corbels. Tiles, coloured on the undersides, form the floors of the balconies, and here stand flower pots. The grille of the balcony is occasionally waist high, but generally covers the whole window and round the top of it runs an iron band to tie it into the wall. Roof tiles cover it. Scrolls decorate the grille at top and bottom, or in the centre, and these are formed by turning the bars round and beating the ends thin. Even the openings on the upper stories of new flats have grilles to their windows, For they are not to protect the Spanish women from too ardent lovers, but rather to express their worthiness of being guarded.

Down a plain whitewashed street, whose flat walls are relieved by an occasional balcony and by slightly overhanging eaves, the outer door to every house or set of flats is open and gives a sudden picture into a patio. These courtyards are quite small, from 10 to 18 ft. square. Often the view from the street is through an inner door of open ironwork, or under an arch, or across the lower steps of a flight of stairs; patterned tiles line the walls of the entrance. The patio is green with vine and palm, or there is a well with pots and a beam across to hold the chain, or a branch of wrought iron holds it. Round the patio run arches on Doric capitals and shafts, to form verandahs and covered passages where dark women sit and work; or the doorway of a poorer house will frame a picture of a bareheaded peasant woman hanging her clothes to dry in the sun; in another there will be only a wide low passage and a stair with pretty iron balusters. Always there is a sense of fitness and of good planning; and there is a conception of building as a frame to proud and stately humanity.

In doors to the poorest homes the simple things, as knockers and nailheads, will be taken and made much of. The escutcheons of locks, the handles, are made lovely with an untiring perception, as though the smiths always worked for their friends. Especially there is a feeling for "weight." Even the very thin iron often used for fanlights and grilles does not look mean, for compensation for its thinness is given by closer spacing.

A TYPICAL PATIO.

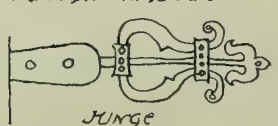


The intellectual note of French work and of some English craftsmanship is absent; all is direct, at worst sketchy, at best lyrical, like a song or an old dance, as the two lamp brackets from Santa Maria la Mayor at Ronda.

The colour effects originally were similar in scale and to some extent in pattern; they were derived from Byzantium and Persia, sometimes direct and sometimes through the Moors of North Africa. The colour was applied to tile-work of floors and walls or to panels of the ceilings. It was simple decoration on flat surfaces, without constructional "value." Later during the Baroque period of the seventeenth century a development took place, and plain tiles inlaid in stucco were used to emphasise construction, especially outside on the roofs and fronts of Seville churches. A dark blue is the main colour, on a grey stuc red, yellow, green and white are som mingled with it. The sky being usually the blue tiles seem necessary to draw the down into the buildings. They prevei contrast between sky and tower or dome too strong. In London spires Wren parallel thing; he opens his work where or cloud is seen through holes in the The increase in the voids gives a lighter

than at Seville, where the play is of colc the solid and where the mass of spire pierced and monumental.

Royal Institute of British Architect



The R.I.B.A. statutory examination f offices of District Surveyor under the L Building Acts or Building Surveyor under authorities will be held at the R.I.B.A., L on October 22, 23 and 24. Applicatio admission to the examinations, accom by the fee of £3 3s., must be received R.I.B.A. not later than October 4. Full p lars of the examinations and application can be obtained from the Secretary, R.I.

THE NEW LIBRARY BUILDINGS FOR THE CITY OF EXETER

THE important question of a new library building has for a long time been considered by the Governors of the Albert Museum, the Town Council, and the citizens of Exeter, and recently some definite progress has been made in selecting the site and approving the design for the new building.

At present the library is housed in the Albert Museum in Queen-street, which was originally designed for a general museum, a library, and an art school, and since 1865–6—when it was erected—the activities of the three departments have been conducted under the one roof.

Time after time the building has been enlarged but as rapidly grew inadequate for the work, and so has at last become totally unsuitable—that is, the library portion of it—from the necessity of more book accommodation and the proper working of it from the readers' and borrowers' point of view.

At last the library is to have a home of its own and soon the art school, it is expected, will follow. The whole of the building then, perhaps enlarged and rearranged, will be devoted to the purposes of the museum—and for that alone—and then the extra space so allotted will not be too ample for the growing collections it will be essential to exhibit.

Another important consideration was the necessity for providing at once very safe accommodation for the splendid and unrivalled records and muniments the city possesses. It was essential that these should be placed in the library buildings for safe keeping and adequate display as well as with suitable accommodation for students studying them.

Exeter—certainly one of the most historical towns of the West—requires a library building worthy of the fine collections already in its possession and which no doubt as time goes on will rapidly be added to. It is a great educational centre. The University College of the South West of England is situated on the outskirts of the city at Streatham Hall—and the new building has already been designed for it—and there are other training colleges and noted schools in and about its neighbourhood.

These institutions made great use of the facilities offered by the library authorities, and when the more ample accommodation that is to be provided in the new buildings is recognised more use still will be made of them.

The selection of the site has been a difficult one, but after many attempts at a decision the garden and site of Rougemont House have been adopted. The garden of this house, now used as a museum, surrounds the great wall of the old Castle of Rougemont and was formerly the ditch around it. The very fine Tower of the Keep, altered by William the Conqueror, still dominates the fine surroundings. Hardly a more beautiful or suitable site could have been selected. The difficulty has been to adapt a plan for the library with its surroundings.

At present the main approach to it is from the High-street, by Castle-street—a very narrow and mean street—which for years has called for amending. On the small scale plan a widening has been suggested. In scheming such an important building as the new library the possible future surroundings call for careful consideration, and it is suggested that a balancing building for administering the work of the county should be erected on the other side of the widened Castle-street, which leads beyond to the important county buildings within the castle walls. Such a building is now a necessity, and in it could be housed all the departments that are now spread about the city in various unsuitable buildings, and the county records and muniments and library could be adequately accommodated. The city and county would then be very markedly associated in the great effort of preserving their priceless and historical manuscripts. It will be seen on reference to the plan that the building is divided into two blocks, one facing Castle-street and the other the garden. The axis of each block is governed by the plane desired for each of these groups, a low block connecting them. The accommodation asked for by the library committee has been amply provided for and the future requirements have been kept well in the foreground. A plan that could be easily and gradually enlarged and the whole scheme thus—perhaps slowly—completed has been worked on. At present only a portion is to be built, but when the whole is finished the building will have accommodation for a really great collection of manuscripts, records and books, and very ample working space for the student. This completion may not be for a generation, but it will have been well thought out and the foundations laid.

The plans here illustrated plainly show the accommodation and arrangements provided. On the lower floor of the front block are placed—to the right—the muniment rooms; and to the left the newspaper and magazine reading rooms; the staff enclosure connecting by a corridor on either side with the garden block, which contains the lending library, staff rooms,

Photo: Mr. John E. Allcorn.

Ceiling at Coleshill, Oxfordshire.

and the work rooms. On one side of the lending library is the lecture hall with the study rooms; and on the other the children's library, with its reference and lending rooms.

The muniment wing is to be a fireproof one, with just one small entrance near the service counter. Its windows face towards the small formal garden and Castle-street. It consists of the large muniment room (planned centrally), the inspection room, and the exhibition room. Galleries are placed over certain portions of these rooms to give more adequate storing accommodation.

The children's library and the lecture hall are placed at each end of the garden block respectively. Each has a separate outside entrance, as well as staff entrances from the lending library. The approach to the children's library is through the small formal gardens, which, in summer, could be used for reading purposes.

The main floor of the building is reached by a flight of granite steps with other flights within the building. Here a large central hall is arranged with the following rooms around it: The librarian's, the committee room—and the large special collection room balancing it—various study rooms, and a manuscript room, and a local records room. The staff enclosure is centrally placed exactly over the one be and is connected with it. Beyond is the refe library, occupying the whole width and of the garden block. The book stack placed on the inner side of this block, ar ends are so arranged that they can be us special collections. Bridges separate from the central area. A gallery surroun whole of this room, which is clearly on the upper floor plan.

Below the stack on this main floor is ar stack over the whole length of the le library, but only over the work rooms an rooms of the floor below.

The upper floor of the front block is arr as a gallery for the display of drawing prints, with a small "Exeter" room o west side. Staff rooms and print rooms o the angles of this block.

On the south side is shown the se service building. Here will be the h chamber, fuel stores, caretaker's qua work rooms, bindery and garage, with a adjoining for the use of motors.

The first portion it is proposed to buil cost, it is estimated, £45,000; and to this sum the Carnegie Trustees have gene promised £19,000. The total cost is esti at about £75,000.

An attempt has been made to kee design of the exterior small in scale as manded by the surroundings. The ex Rougemont House is placed rather too ne tower of the old Castle, and the mass side elevation is too great as well as too n be quite happy. The pavilions of the pro new garden block at this north end of th are so arranged as to allow the ruins of this fine tower, as well as the adjoining great w the castle, again to dominate the whol as well as the new building. These new b will be kept lower than the existing Rouge House.

The side elevation to the front block is divided architecturally as to lesser length; and the main entrance front an long façade to the garden are similarly tr In all cases a vertical line is aimed for ir of a horizontal.

Internally, the top lighted entrance hall its vaulted ceilings and galleries, afford room for the display of books and print drawings of local interest—either in show or hanging on the walls.

The large window over the porch, wit smaller side ones, will light the staircases their landings and half landings, and s form a pleasing feature of the interior.

The great Reference Room is excepti well lighted along the whole of its lengt ends by large windows overlooking the g

The galleries, with their simple railing panelled book case ends, should be an inter feature of the interior of this spacious r room.

Little has yet been decided as t materials to be used. The local bricks ge are not pleasing either in regard to text colour. They look red, hard and rav would clash badly with the delightful g surroundings. The local white stones, s Beer and Salcombe, are hardly suital exterior work as so well illustrated l Cathedral and the Guildhall. The very be "volcanic trap" stones found in the bourhood, such as Thornton and Pocom Poltimore, are extremely difficult to quar expensive to work—so costly as to mak use in a large modern building prob It is suggested that a mottled-brown b used for the general facing and a dull r sparingly used for the quoins and jambs windows and other openings. Certain p will be built of Portland stone, such cornices, plinths, and strings, and th granite for the outside steps and ma lower entrances.

The architect is Mr. Sidney K. Gree F.R.I.B.A., of Exeter, and 11, Gray square, London, W.C. 1.

THE COMPLEAT ARCHITECT

By DUDLEY HARBRON.

XVI.—Design.

object of our endeavours is to render es creditable exponents of our art. The beauty, as beauty, is like the pursuit of low of ourselves. The representation of without the employment of a language hnique is not so efficient a means of con- our intention as is the barking of dogs. m a sincere realisation of the need for ge and a grammar of art that the artist so arduous an apprenticeship and so an overhauling of his working opinions. e conception to the execution is only half arch; the artist leaves off there—at stone. The completion of the fabric e performed by the recipient, without has no existence. For this reason, the nt interest of the man in the street is sary.

and other philosophers have devoted ds of pages to the consideration of the of beauty, and still we are as far as m the solution of its processes. The reation cannot be reconstructed, even uld discover the receipt. The positive readily isolated by detaching one by negatives which obtrude between the on and its realisation, or which may be in the incomplete or impure conception. —or beauty—should remain after ugli- been removed. How, then, does the roceed to reject the negative qualities that the positive may solely remain? ively, is it possible to employ only eans and forms which have æsthetic ion? It is, indeed, only by some such that he can hope to anticipate the ho will, in the reverse order, commence olish the artist's presentation of his on. In so far as the representation is ble is the critic compelled to approval. ic is not anxious to help the artist; ccupation is with the public. The the faculties of the mind are called into the inception and planning of a con- -memory, will, instinct, reason and In turn, they are influenced by environment and acquirement, whose l force tinge and complete personality. great artist is simply ego, and no ing work of art is less than universal. vidual, however eminent, is less important than humanity. Only when in his own personality he embodies mankind is he of the first order. There are degrees of beauty; if there were not life would be very monotonous. The subject as well as the form contribute to the classification of a work of art. A bride-cake has not the permanence of a cathedral. Pure art is useless except as æsthetic experience. A monument is the nearest approach which architecture makes to this seemingly unsatisfactory realm.

In considering architecture it is difficult to disentangle the creative from the expressive, they are so close upon the heels of each other. An architect does not conceive a bank entire in a moment of inspiration, and yet in realisation it may not fall short (excepting its subjective limitations) as a work of art. The plan, the mass, may be resolved in an instant, after prolonged consideration and experiment.

A work of art requires an antecedent history of thought and study. One would have imagined that this was sufficiently obvious, were it not for the widespread idea that the act of creation was the formulation of something out of nothing. The architect commences to design a building as an artistic problem. To solve the problem requires the full employment of all his faculties. In as much as they are equal to the demands of the subject will his solution be acceptable. It does not matter how we get the requisite knowledge, so long as we get it; having obtained it it is not so important that we should keep it as that we should know how to employ it. All knowledge is useful if we use it.

It is interesting to consider in what order he considers the subject; a systematic method of approach, if such can be constructed, would be very helpful to the student. We all have to evolve our own, as I have never seen any sequence set down on paper. In the first place it is necessary to realise all those requirements actual and potential of the particular problem with which we have to deal. These are the fundamental considerations no matter what the nature of the subject requiring a solution. It requires a knowledge of individual and social conditions, modes of life—in work, relaxation, or recreation—processes of manufacture or merchanting, viewpoint of employer and employed, indeed, so much of the complicated machinery of civilisation as is contained in and impinges on the theme. It is the same process of precedent, of intelligent anticipation in varying degrees of difficulty, but in all cases it is requisite and desirable that we should learn all that there is to learn before we can attempt an essay in the second stage of composition. This next step consists in so disposing inanimate matter in such shapes and formations as will conveniently clothe and dispose the humanity for whose use and occupation it is intended. Length, breadth and height of the whole and component parts, have in addition to be determined—when the second merges in the third stage—the nature of the material in which the theme has to be carried out. This is chiefly determined by the permanence of the theme, so that the clothing shall last so long as the idea which it enshrines shall be satisfying. Quantity as well as quality of material are contributory to the realisation of the imperishable. The whole has then to be reviewed from the appreciation of the need of providing conditions congenial to the development of man—air, light, and warmth, not only for ourselves, but for our neighbours—for it is the design of habitations which we are considering not tombs. Lastly, (though in actuality there is no lastly, the whole must be judged in relation to outlay. Do benefits bearing any reasonable proportion or relation to the expenditure of labour, time, material and money accrue? Has or will any man suffer or be degraded by the diversion of his energy upon a needless project, or any part or portion thereof? Should the truth answer to this searching examination in all its stages and in all its parts, we shall have reached to as near perfection as such imperfect creatures are ever likely to arrive. The compleat architect will be rewarded by complete architecture.

New Books.

Messrs. B. T. Batsford's list of autumn announcements includes: "English Decoration and Furniture of the Early Renaissance," by Margaret Jourdain; "The Human Form and Its Use in Art," by F. R. Yerbury and G. Montague Ellwood; "The Story of Architecture," by P. Leslie Waterhouse; "The Cathedral Churches of England," by Helen Marshall Pratt; "Colour Schemes for Modern Interiors," by well-known Continental architects and designers; "Regulations of the London County Council Relating to Structural Steel Work (London Building Act Amendment, 1909), and to Reinforced Concrete, 1916," by Ewart S. Andrews; and "Structural Design in Steel Frame Buildings," by Percy J. Waldram

New Premises of the Hong Kong and Shanghai Banking Corporation, Hankow.

Messrs. Palmer & Turner, Architects.

[This new building is of reinforced concrete construction, faced with granite from the quarries at Tsing Kang. Spacious verandahs are provided for use during the summer.]

Library Buildings, Exeter.

The new library buildings for the city of Exeter are described on p. 432. Mr. Sidney K. Greenslade, F.R.I.B.A., is the architect.

Barclays Bank.

This building, at Nos. 80 and 81, Fleet-street, has been erected at the corner of Fleet-street and Salisbury-court, for Messrs. Barclays Bank, Ltd.

The banking premises occupy the whole of the basement and ground floor except the portion required for the entrance and staircase to the offices above. The banking hall is 46 ft. by 41 ft. clear span entirely free from stanchions, four of the floors over being also similarly free from stanchions.

The walls of the hall are lined all round with a panelled mahogany dado with a marble skirting and marble architraves around the radiator recesses. Above the dado the walls are panelled in plaster finished a cream tint. The counter is in mahogany, also with a marble skirting. The counter grilles, with the glazed panelled fronts to cashiers' desks, are in solid bronze. The floor of the public space is black and white marble.

The managers' and waiting rooms are panelled in mahogany up to frieze height.

The street entrance to the offices over the bank is lined with marble, and the walls of the main staircase and corridors with Medmenham tiles.

Both elevations are faced throughout above the plinth with Portland stone, the plinths and architraves to entrances being faced with polished grey Aberdeen granite. The roof is covered with Westmorland slates, with ornamental copper ridges and hips.

The contractors are Messrs. Allen Fairhead & Son. The sub-contractors are as follows:—Steel construction: Messrs. Sanders & Forster, Ltd.; concrete flooring: Messrs. The Siegwart Fireproof Floor Co., Ltd.; granite, marble paving and wall linings: Messrs. Fenning & Co., Ltd.; Portland stone: Messrs. F. J. Barnes, Ltd.; marble terrazzo staircase paving: Messrs. Malcolm Macleod & Co., Ltd.; artificial stone: Messrs. The Patent Victoria Stone Co., Ltd.; tile wall lining: Messrs. The Art Pavements & Decorations, Ltd., and Messrs. Carter & Co. (London), Ltd.; hot water heating: Messrs. Stitson, White & Co.; electric lighting: Messrs. A. F. Goodwin & Co., Ltd.; electric light fittings: The Edison Swan Electric Co., Ltd.; wrought ironwork: Messrs. Hill & Smith, Ltd.; passenger and hydraulic lifts: Messrs. Aldous & Campbell, Ltd.; metal windows, lift enclosure and bronze counter grilles: Messrs. The Crittall Manufacturing Co., Ltd., and The Crittall Freeman Bronze, Ltd.; copper work: Messrs. F. Braby & Co., Ltd.; asphalte work: Messrs. Thomas Faldo & Co., Ltd.; decorative plaster work: Messrs. F. De Jong & Co., Ltd.; ironmongery: Messrs. Carter & Aynsley, Ltd.

The clerk of works during the erection of the greater part of the structure was Mr. B. S. Ravenscroft, and during the remainder until completion, Mr. J. C. Swallow, A.R.I.B.A.

The architects are Messrs. C. J. Dawson, Son, & Allardyce.

The Chalet du Bois, Le Touquet.

This drawing illustrates the garden court at the house recently carried out for the Rt. Hon. The Earl of Dudley, K.C.M.G. The materials used are red brick and stucco for the walls and hand-made tiles for the roof. The piers to the garden pergolas are constructed of roofing tiles with oak beams over.

The general contractors for the work were Messrs. J. W. Falkner & Sons, of London, and the firm responsible for the heating installation was Messrs. James Gray, Ltd., of Chelsea. The garden work was carried out by Messrs. Jas. Cheal & Sons, of Crawley, in conjunction with the architect, Mr. A. B. Llewelyn Roberts (Messrs. Collcutt & Hamp), 126, Wigmore-street, W.1. The perspective drawing is by Mr. Kenneth Anns.

Cottage at Elstead, Surrey.

Beautifully situated on the edge of a heather-grown common and flanked by woods, the original cottage consisted of a living room, scullery and large larder on the ground floor with three bedrooms on the first floor. The entrance was direct into the living room and the building was very damp, the walls and floors having been built direct upon the earth without surface concrete or damp courses. The roof was also overgrown with ivy and in an unsound condition. The necessary work of renovation was therefore considerable; old floors being taken up, a surface water drain being made under the entire length of the building, waterproofed concrete being laid over the floor area and horizontal damp courses being inserted in all the walls.

The original living room was converted into a dining room, the old fireplace being opened up, and the old larder was incorporated, thus giving extra light and a view of the common at the back of the house. A new library has been planned at one end of the building with two bedrooms and a bathroom over. All the woodwork in the library and new joinery work in the dining room is of well-seasoned oak, hand-worked where possible, including ex ranges of bookcases and other library A porch has also been added, and the old has been converted into a serviceable with the necessary offices adjoining. In stone paving and a low dwarf wall now su the house, and the well head forms a fea the stone flagged informal garden. Dull coloured bricks, harmonising with the work, and dark brown plain tiles have bee

Messrs. Glazier & Ellis, of Elstead, were the builders, and Mr. K. M. B. Cros (Messrs. A. W. S. & K. M. B. Cross), architect.

"Warden," Surbiton.

This house is in course of erection at Su and the contractors are Messrs. Limpus of Kingston-hill, Kingston-on-Thames.

The walls are faced in multicolour hand-made bricks; 11 in. hollow walls ar the bays and windows being in oak, wit casements and lead lights by Messrs. & Co.

All the joinery is being made by Messrs. H Hill. Among the other sub-contractors are T. S. Knight & Sons, of 222, Great Por street, W., who are carrying out the hot services, and Messrs. Bratt, Colbran & Co., Mortimer-street, W., are supplying the places, etc.

The architects are Messrs. H. F. Murre R. M. Pigott, AA.R.I.B.A., of 35, Bedfor W.C.1.

House at Oxford.

Planned for erection on a site commanc fine view of Oxford, this house is design provide the required accommodation moderate cost consistent with convenien service and the use of sound materials. cavity walls are faced with multicol sand-faced bricks, the quoins being en with dark-red facing bricks of simila ture. The roof is to be covered with red hand-made sand-faced plain tiles; al side woodwork is to be painted white, incl casements and frames, and the front door be painted a fresh green with moulded arch and hood painted white.

Mr. K. M. B. Cross, M.A. (Messrs. A. and K. M. B. Cross), is the architect.

St. Luke's Church, Maidenhead.

This chapel was built as a Lady Cha the church and also as a war memoria forms a continuation of the north aisle church and is built in Chilmark stone; th boarding is painted blue with white stencilled with patterns of vine and flow colours, the principals and purlins being i The floor is concrete covered with Rub in squares. The east window, in su

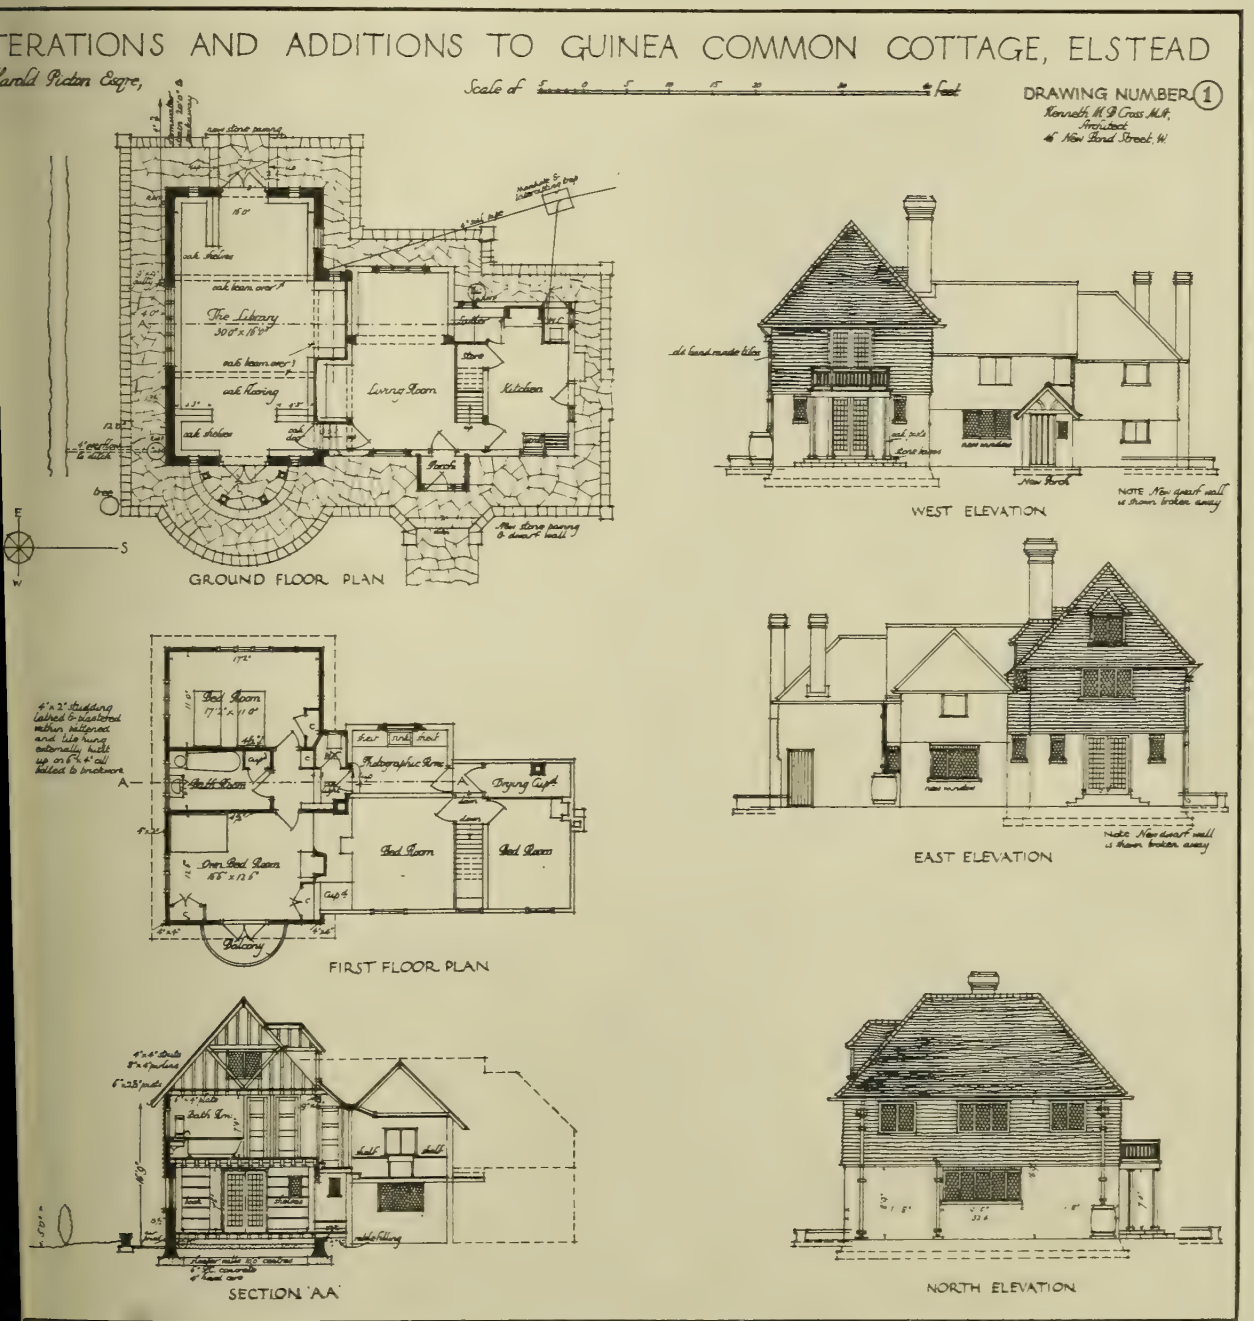
, is by Mr. A. K. Nicholson, 105, Gower-. 1. The altar and altar rails are oak umed, with limewood carving applied e ground, made by Messrs. Bowman & Stamford. The altar cross is of silver ry inlaid and precious stones. The ks are of silver with enamelled coats the work of Mr. Bray, 2, Sandeland-.C. 1. The altar linen and dossal are Beckh, of 20, Thurloe-place, S.W. 7. nded to panel the walls in oak with a loured and gilt oak reredos at a future he general contractors were Messrs. Son, of Castle-hill, Maidenhead, and itects Messrs. Cheadle & Harding, quare, Lincoln's-inn, W.C. 2.

Pantiles," Lyndale, Hampstead.



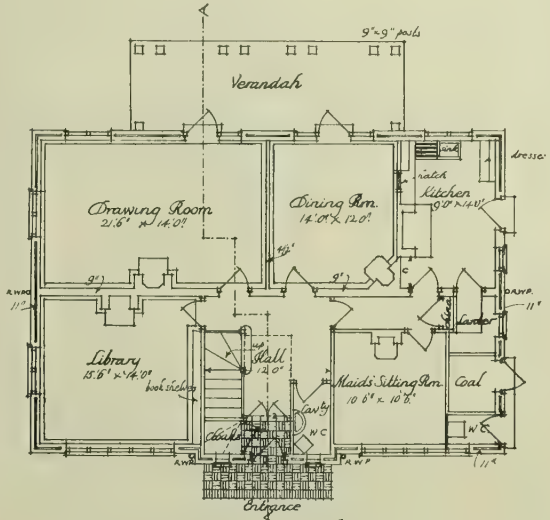
ouse is built of hand-made multi-sand-faced bricks, pointed in cement, le creasing. The roof is covered with pantiles. The house was designed with a view to being run with the minimum of domestic help. Access to all parts is obtained from a central octagonal hall. The drawing-room is a large room on the first floor with good views; this obtains additional height by running up into the roof and showing the rafters. The floor is of Jarrah. The contractors were Messrs. Foster & Dicksee, of Rugby; Messrs. Cheadle & Harding, of 2, New-square, Lincoln's-inn, W.C.2, are the architects.

Dalston Victory Hall, near Carlisle.

This hall has been built and completely equipped under the direction of a representative local committee. It has a good dancing floor, and is lighted by acetylene gas and warmed by low-pressure hot-water apparatus. The builders' and plasterers' work was executed by Messrs. J. & R. Bell, the facing bricks being Whitehaven and Sandysike. The joiners' work, including a bold open timbered roof, was executed by Messrs. Craig & Macdonald, who used Columbian pine for the internal joinery. The plumbers' work was executed by Messrs. Harrison Bros., who also carried out the heating and lighting work. The slating was carried out, in strong Cumberland and Westmorland green slates laid in diminishing courses, by Mr. John Hewitson, and the painting and glazing was executed by Messrs. R. S. Kirk & Son. The cost was about £3,000, and the aim throughout has been to provide a completely fitted-up hall, with club rooms, &c., yet not to depart from the village feeling. The architect is Mr. H. E. Ayris, of Carlisle.

Whitton Grange.

The title and name on plan on page 394 of our last issue should have been: Whitton Grange: Plan. Messrs. Mauchlen & Weightman, Architects.



Alterations and Additions to Cottage at Elstead, Surrey.

PRACTICAL DESIGN FOR BUILDING CONSTRUCTION.—VIII.

AN ELEMENTARY EXPLANATION OF THE APPLICATION OF THE THEORY OF CONSTRUCTION TO PRACTICAL DESIGN

By EWART S. ANDREWS, B.Sc., M.I.Struct.E., A.M.Inst.C.E.

SECTION II.—FLOORS AND BEAMS—Contd.

Loads and reactions on beams—The first problem in designing a beam is to determine the maximum value of the bending moment on the beam, and before we can do this we must know exactly what loads the beam has to carry and the value of the reactions at the ends of the beam.

The reaction at the end of a beam is equal to the pressure which the beam exerts on the support at that end.

One of the fundamental laws of mechanics (sometimes called Newton's Third Law of Motion, although it does not necessarily have anything to do with motion) is phrased in orthodox language as "To every action there is an equal and opposite reaction."

In ordinary language this means that if one body A presses downwards on another body B with a given force, then B must pressure upwards on A with the same force. This follows as necessarily true if Newton's First Law is true; and up to the present we cannot find anything wrong with that. The First Law states that if a body is at rest all the forces acting upon it must be in equilibrium; now if there are only two forces acting they can only be in equilibrium if they are equal and opposite, so that the downward pressure of A must be exactly equal to the upward pressure of B.

The first thing, therefore, that we must be able to do with any beam is to find the reactions at the ends. In order to do this we employ the principle of moments which we have already used in connection with walls. This principle states that if a body is in equilibrium the sum of the moments about any point of all the forces on the beam must be zero. In the case of the ordinary beam all the loads in the beam act vertically downwards, and the reactions act vertically upwards, and we can vary the statement of this general principle in the present case to the following form:

The sum of the moments about any point of the loads on any beam must be numerically equal to the sum of the moments of the reactions about the same point.

Before going further, we will remind the reader that moments have signs; those which tend to move the body in the direction of the hands of a clock (clockwise moments) are usually called positive, and those tending to move the body in the opposite direction (anti-clockwise moments) are called negative. In speaking of the sum of moments we mean the sum with due allowance for the signs.

Now let us apply the general principle to the case of the beam illustrated in Fig. 13; three loads are shown anywhere on the beam and P is any point about which we take moments.

We can then tabulate our moments as follows:

Moment of R_1 about P = $R_1.y_1$
Moment of W_1 about P = $-W_1.x_1$
Moment of W_2 about P = $-W_2.x_2$
Moment of W_3 about P = $-W_3.x_3$
Moment of R_2 about P = $-R_2.y_2$

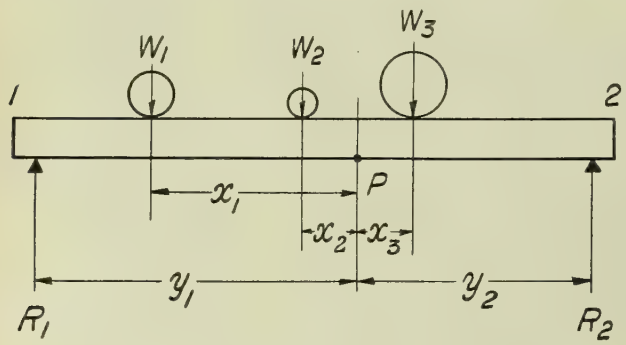

FIG. 13.

The general principle states that:

$$R_1.y_1 - W_1.x_1 - W_2.x_2 + W_3.x_3 - R_2.y_2 = 0$$

We can always change a term of an equation to the other side by changing the sign; so keeping the R's one side and the W's the other we have:

$$R_1.y_1 - R_2.y_2 = W_1.x_1 + W_2.x_2 - W_3.x_3 \quad \ldots (1)$$

This proves the statement printed in italics in column 1.

Now the point P can be chosen anywhere convenient, and by taking it at one of the supports (say 2) one of the terms on the left-hand side of equation (1) will become zero. This leaves us with an equation in which the only unknown quantity is one reaction, so that we are able to find that reaction at once.

In addition to this rule we have the rule that the total upward force must be numerically equal to the total downward force, so that if we know the total load and one of the reactions we can find the other reaction at once by subtracting the known reaction from the total load. This gives us the following procedure for finding th reactions:

(1) Take moments about one of the suppor of all the loads, and thus find the reaction the other support.

(2) Subtract the reaction thus found from t total load to find the second reaction.

Numerical example (1).—A beam of 20 ft. sp carries a uniformly distributed load of ½ ton p foot run, and an isolated load of 6 tons 5 from the left-hand support. Find the reactio on the supports. Fig. 14 illustrates the arrang ment; uniformly distributed loads are ve common in practice, and for purposes of t calculation of reactions we assume that t total load thus distributed acts at the centre the length over which it is distributed.

Beams of this kind are said to be simp supported, and the supports are diagramma cally represented by knife edges as shown the figure. If the ends of a beam are continuo over the supports, or are otherwise so fix that the beam cannot deflect freely between supports, the reactions and stresses beco quite different and cannot be dealt with in t manner now being described.

We now proceed as follows:—

Load distributed = ½ × 20 = 10 tons.
Total load = 10 + 6
= 16 tons.

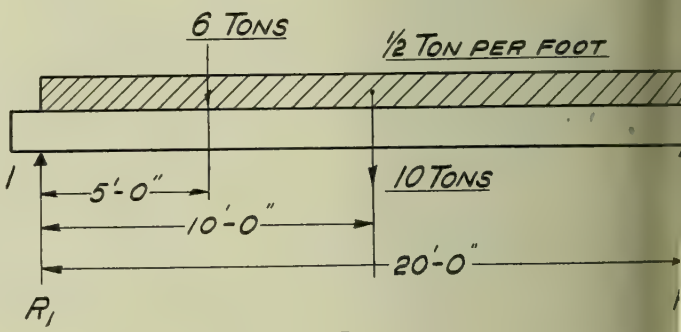

FIG. 14.

Now take moments about the point.

Moment of isolated or point load = 6 × 5
= 30 ft. tons.
Moment of uniform load = 10 × 10
= 100 ft. tons.
Sum of movement of loads = 30 + 100
= 130 ft. tons.
Movement of reaction R_2 about 1 = $R_2 \times 20$.
But moment of reaction = sum of moments o loads.
$\therefore R_2 \times 20 = 130$
$R_2 = \frac{130}{20}$
= 6.5 tons.
But $R_1 + R_2$ = total load = 16 tons.
$\therefore R_1 = 16 - 6.5$
= 9.5 tons.

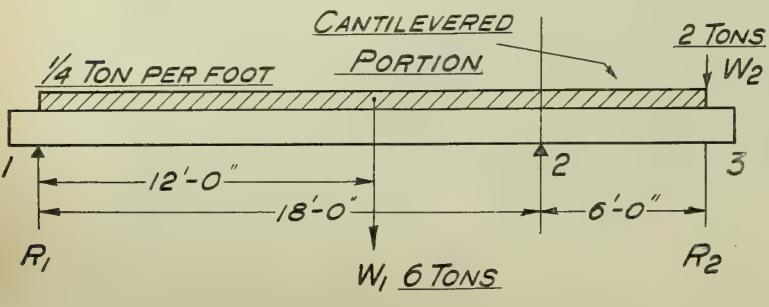

FIG. 15.

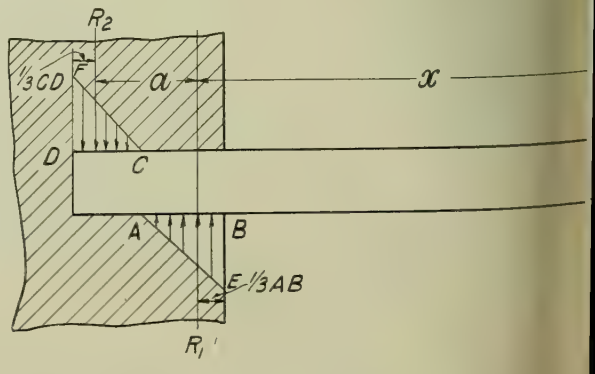

FIG. 16.

n check the accuracy of our working by
noments about the point 2 and thus
ng R_1, and the student is recommended
is as an exercise.

ical example (2).—A beam rests upon
18 ft. apart and projects at one end
ond the support; the beam carries
nly distributed load of $\frac{1}{4}$ ton. per ft.
ughout its length and an isolated load
rojecting end: Find the reaction at
l. The arrangement in this case is
d in Fig. 15; the portion of the beam
g beyond the support is said to be
red.

ilever is a beam which is fixed in direc-
ne end and is free or unsupported at
r; the branches of a tree are canti-
The beam is supported on points 1 and 2,
jects on the right-hand side to the

stributed load is $\frac{1}{4}$ ton per ft. run.
ributed load = $W_1 = \frac{1}{4} \times 24$
$= 6$ tons.
ted load $= W_2 = 2$ tons.
Total load $= 8$ tons.

iform load is regarded as acting at the
its length as indicated, that is, 12 ft.
support 1 and 6 ft. from the support 2.
he reaction R_1, take moments round the
2.

en have :—

t of isolated load $W_2 = 2 \times 6$ (clockwise).
$= 12$ ft. tons.

t of uniform load $W_1 = -6 \times 6$ (anti-clockwise).
$= 36$ ft. tons.

l moment $= -36 + 12$
$= -24$ ft. tons.

Now the moment of R_1 about $2 = R_1 \times 18$.

$R_1 \times 18 = -24$
$R_1 = -24$
$\frac{}{18}$
$= 1.33$ tons.
$R_2 = $ Total load—R_1
$= 8 - 1.33$
$= 6.67$ tons

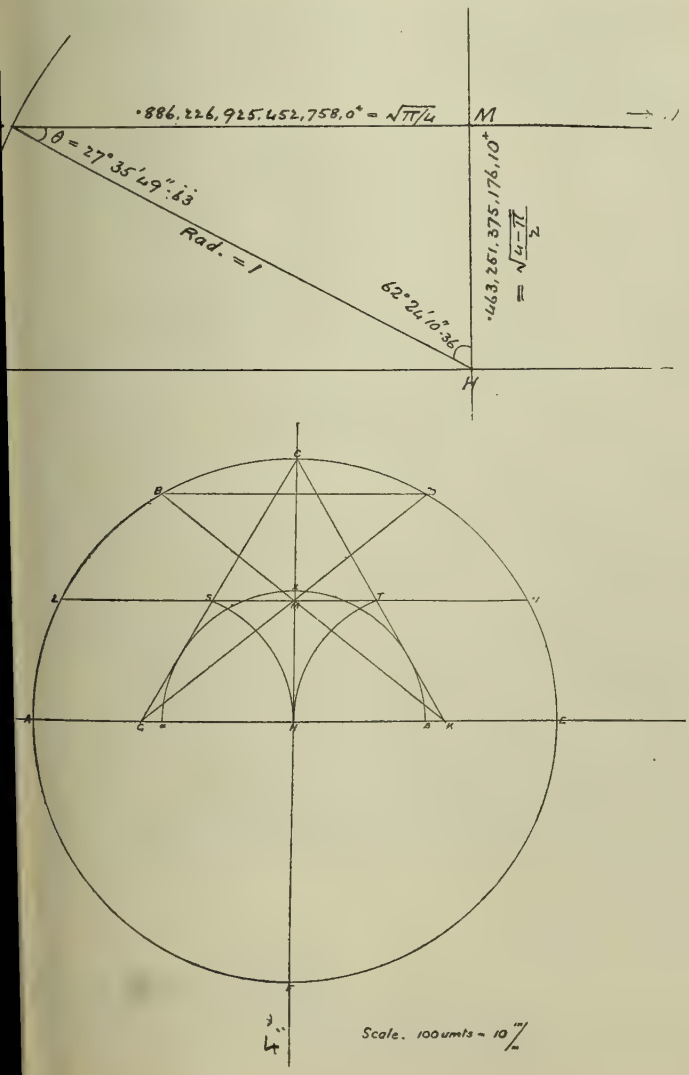
The observant reader will at once ask why the minus sign has been dropped; the reason is that we do not worry about the sign of reactions so long as the two reactions come of the same sign, but if they come of different signs we know that one will act downward and the other upward. It is possible to obtain a downward reaction in a cantilevered beam, and it means that the weight on the projecting portion overbalances that on the other or anchor portion, and that the beam has to be positively held down to prevent the end from lifting. It will be noted that, in our previous statement in italics of the rule for reactions, we said that the sum of the moments of the reactions was numerically equal to the sum of the moments of the loads; the two are not algebraically equal, but are in fact opposite in sign. This will be clear from equation (1), since $W_1 . x_1$ and $W_2 . x_2$ are both anticlockwise, but are positive in the equation.

The Reactions in a Cantilever.—Many students get into difficulties when they try to find the reactions of an ordinary cantilever, such as that indicated in Fig. 16; this is largely due to the fact that the text-books are usually silent upon this point and the explanation is not altogether free from difficulty.

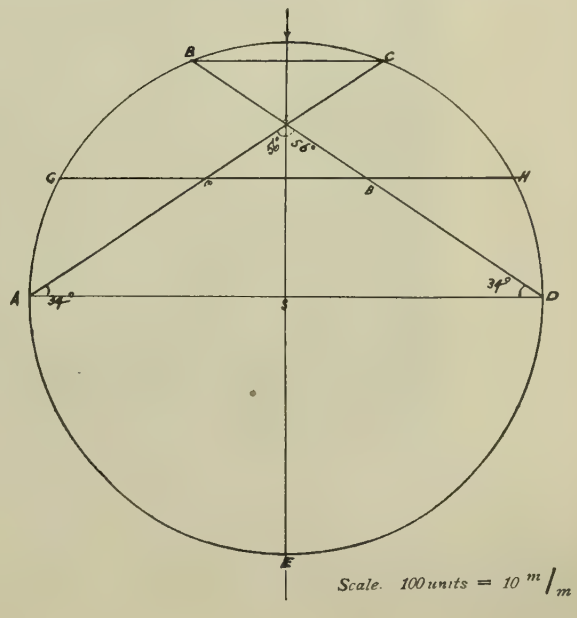
The fact is that, at the support of a cantilever, there is strictly not a reaction, but the effect is that of two reactions near to each other in the anchored portion of the beam and opposite in direction. The exact dispositions of these reactions is impossible to forecast, but it is probable that, from the edge B to a point A, the beam presses downwards upon the brickwork or other material of the wall, and presses upwards from the point C to the end D. If this is true, we should expect the downward pressure to be greatest at the edge B and diminish gradually to the point A; we should also expect the upward pressure to increase gradually from the point C to the point D. This will give us two pressure diagrams indicated by the triangles E B A and F D C. The resultant pressures, R_1, R_2, represented by the areas of these triangles, will then act in the lines indicated. In order to estimate the values of these reaction pressures, we will note that, by taking moments about the line of action of R_1, we must have :—

$R_2 \times a =$ Sum of moments about line of action of R_1 of all the loads on the cantilever $= Wx$ in our case.

We shall have a larger number of further examples of calculations of reactions when we come to consider bending moments.



THE QUADRATURE OF THE CIRCLE



"How to square the circle" has been the dream and the perplexity of mathematicians for many hundreds of years. Innumerable approximations have been found showing more or less ingenuity, but none of them capable of proof by pure geometry. The diagrams given on this page show a solution by Mr. T. C. Dennison, of Thornton-avenue, Chiswick.

In the drawings which accompany this description a construction has been adopted which is applicable to any circle, and which, if accurately drawn, will give absolutely correct results, capable of mathematical proof. It is based upon the fundamental truth enunciated in the following theorem :—

If a circle be enclosed by a square and bisected by its diagonal, the co-ordinates round the point of bisection, together with the diagonal of square so formed, are equal in length to radius of circle.

Construction.—Let A B C D E be the given circle. From the points A and D, with radius equal to 4 ($\sqrt{2}$–1) cut the circumference of circle at B and C, and join B C. Also join A C and D B and bisect them at α and β; and parallel with the diameter A D draw G H through the points α and β. This construction makes the angles D A C and C A D = 34 deg., and the angles A × S and D × S = 56 deg. The line G H is the side of a square equal in area to that of the circle A B C D E. The above construction is the result of many years of patient labour, and it is intended to publish it, with the mathematical proofs, and to show at least four different methods of arriving at the solution.

BOOK REVIEWS

Small Houses for the Community. By C. H. JAMES and F. R. YERBURY. (London: Crosby Lockwood & Son. 1924.) 31s. 6d.

It has been said by one competent to judge that the housing problem with which we are wrestling will continue to absorb our attention for two generations yet to come. This is probably true and therefore it is necessary that the problem be approached in a comprehensive manner, that it be recognised as a permanent and not a temporary question, and that accordingly it must be settled on a permanent basis. Legislation can render valuable assistance by the removal of burdensome and effete by-laws and by placing reasonable restraint on private obstruction and aggression, but the ultimate solution of the problem must lay largely with those who are actually engaged in the design and construction of the houses—with the measure of skill on the one hand and honest work on the other. The difficulties of the problem are now well known and appreciated. In the volume before us we have a welcome and valuable contribution to the subject which should be of great assistance to those engaged in the work of actual construction.

The scope of the work is well expressed by the authors in the introduction. "It is the intention of this book to place on record for the use of those to whom they may be of value some of the best examples of completed work, showing that it is possible to carry out housing schemes and build small houses without either outraging the æsthetic sense on the one hand, or ignoring the question of cost on the other." The book is divided into four principal sections: the text, in which various practical aspects of the housing problem are discussed; a series of plans and photographs of small houses and cottages recently built in the newly-developed districts of London and the provinces—this is the largest section; plates of detailed drawings; and an appendix consisting of working drawings, specifications, and bill of quantities for a group of fourteen cottages at Welwyn Garden City. In the text are some remarks on such pertinent questions as site planning, design, materials, construction, and internal arrangement. The old method of laying out a residential building site was by means of long parallel roads, usually far too wide and having expensively constructed carriage ways. These were connected at intervals by short cross roads, which were merely flanked by the ends and the gardens of the houses in the longer roads, and were therefore useless as far as the development of building plots was concerned. Many wide roads served only a small number of houses, or even a cul-de-sac, and soon acquired that unkempt and weed-grown appearance which may be seen on the outskirts of many of our towns. These expensive methods of lay-out led to the charge for plots not by area but by the foot run of frontage and consequently to the reduction of the frontages of houses, so that often only 16 ft. or even 12 ft. was given to each house. It is now recognised that economy in the space devoted to road surface is an important factor in the general economy of the development of a building site, and that the less road construction it is necessary to mak less will be the general cost of develo and the greater the plot which can be for the same price. Many useful ob tions are made on the economical pla and lay-out of a site on these principles.

In respect to the design of the indi houses the principal factors to be cons are doubtless the materials available an locality of the site and the local traditi its neighbourhood. It would conduce b economy and good effect if the neighb cottages of a given site were examined deciding on the design for new work. are often very good reasons for the cha of the work pursued for centuries in localities, not at first apparent. Ther be no question but that while individua permissible and desirable in the develo of a residential area regard must be h the effect as a whole. On the subj design the authors say "Little thing very much in simple houses, and nothin be allowed to go unconsidered. The gr care must be exercised in the design placing of chimney stacks, which always be simple and with projections, i not exceeding three-quarters of an inch. flatter the pitch of the roof the shorte chimneys may be. Horizontal line window and door heads should be car followed out round a building. Eaves be proportionate in projection to the pi the roof, the steeper the pitch the nar the soffit. Fascia boards must be stopp kneelers or else returned at ends, and not exceed 4 in. in depth unless definite quired to give the effect of a cornice,

Vestries, St. James' Church, New Brighton, Wallasey. MR. A. RALPH KEIGHLEY, A.R.I.B.A., Architect.

[This church was designed by Sir Gilbert Scott in the early 'fifties. The new addition provides a large vestibule giving access to a clergy and to a choir vestry, the latter big enough to be used as a meeting room for adult classes when required. Lavatories are provided for both vestries independently. The addition is in Storeton stone, with a vertical dampcourse in the thickness of the walls. The roof is of Precelly slates. All the visible woodwork is Austrian oak, with gunmetal fittings. The vestibule and lavatories have tiled floors and the vestries wood block floors. Gas stoves the heating. The cost of the a furnished, is £3,100. The builders are W. Thornton & Sons, and the archi A. Ralph Keighley, A.R.I.B.A., of pool.]

istance of a bed mould will also be d."

plates of photographs and plans con- ne excellent examples of small houses tages recently erected in various parts country. These are built of various ls—though those with brick walls and ofs predominate—and are shown in nd arranged in blocks and groups. A g close of cottages at Welwyn garden ilt of concrete blocks, cement ren- nd roofed with tiles, and illustrated es xxxii, xxxiii, demonstrate clearly sfactory effect which can be obtained employment of these materials. Good s are also shown of the use of boarding in the upper stages, particu- a group of four cottages in plate A few examples from Holland, k, and Sweden, including some houses recently built near Stockholm, ed. All the photographs are very d sufficiently large for their purpose. ustrate some of the best examples of work and should assist in no small in establishing the high standard of of this class of house which these s have set. The encomium passed Raymond Unwin in his Foreword to is well deserved. "This volume," , "fittingly marks a success in that uggle to establish a new technique in using of the people. The housing which it portrays, whether carried municipal, public utility, or private have established beyond doubt the bility of the high standard of attain- own. That standard no one who is ble for housing work can afford to Who falls below it will in future escape reproach." The appendix most useful adjunct to what is a and opportune work.

aluation Policy. By JAMES DUNDAS ITE, M.A., LL.D., of Trinity College, bridge, Barrister-at-Law. (London: lished by the United Committee for the ation of Land Values. 1924.) 2s.

s a little volume of 196 pages and an d its object is to advocate the taxation ng of landed properties on the basis of d values, or, to quote from the author, we need is to reconstitute the public on lands—or in other words, the rates s on landed properties—on the basis of ple principles, (1) That the land which has provided ought to be regarded as property, and that those who hold it ay the people a rent for it, based on its value for the time being; and (2) that rovements, both present and future, e regarded as belonging to those who em, and should be relieved from public s much as possible."

t not be thought that the author simply o revive the land taxes which proved ilure under the Finance Act, 1909–10, ge 84 he says "They did not deserve the Duties on Land Values and were substitutes for the real reform," but this will have been already gathered quotation we have given above, for ple talk of the land being "the common of the people" and euphemistically taxation as "a rent paid to the people" t require great acumen to discover that m they advocate involves the divesting e rights in property and a system of which inevitably leads in the end to on. We do not propose in this notice he question, but that the above state- he proposals this little handbook con- ccurate can be shown by a very few s. We start with one sentence in the "Justice requires that all the people ve equal rights in the land which as provided." The capital N is the

e find that "Any tax or rate on land ht to be regarded as a rent paid to the y for the land and should be payable the land is held, apart from any ques- tion whether it is being used or 'occupied' in the technical meaning of that word." Further, that the public charges on the land value of each property should be treated not merely as a personal debt, but as a first charge on the land, and that if those charges are not met within a certain period "the community should be entitled to resume the land, and if payment is not made within a certain further period the community should be entitled to resume the land absolutely."

Systems of taxation or industrial enterprise based on confiscation of private rights are attractive reading, as they always show brilliant results and huge profits, and this volume is no exception. We do not care to discuss the obvious inherent difficulties in the system, nor to raise the question whether in practice the land so treated, irrespective of the actual returns being obtained from it, would not eventually so depreciate that the end aimed at would not be attained, as it is sufficient to indicate the general principle advocated in this little volume which concludes with a series of "Notable Sayings," in which Henry George and his followers figure, and which purport to point to the attainment of Utopia, but do not look far enough into the future to discover the "Paradise Lost" which may well be the sole fruits of any such system.

I for One. By J. B. PRIESTLEY. (London: The Bodley Head.) 6s. net.

It is a pleasure to review a volume of good essays. Good essayists are rare, but it is a mistake to believe that the fine art of essay-writing ended with Lamb and Hazlitt. It is an art which makes a double appeal to architects. They can appreciate a form of craftsmanship involving literary grace and exquisite taste, and they cannot neglect a medium which deals playfully with various aspects of life and art. The preferences may be individual and the sentiment elusive, but they represent the views of a highly cultivated mind, endowed with tolerance and sympathy. Mr. Priestley can claim most of the rare qualities of the good essayist; he has the light touch which can traffic delightfully with fancies, and the sense of humour which laughs at our little affectations, at the same time disguising the serious thought which lies below the surface. Hear him in his Essay on Cranks:—

"The eccentric merely discovered a mode of life which suited him; the crank has found a way for everybody; he possesses a panacea and is aggressive, militant, proselytising. The mark of the crank is his unshakable belief that his own particular crotchet will save the world."

He likes the soft opaque colours of toy balloons, and the beautiful spot of colour they make in our streets. This fancy leads him to wonder what would happen to such pretty trifles in the solemn economic utopias which some people are always fashioning for us.

"We might even agree to make the toy-balloon some sort of test for our prophets and grand, sweeping reformers. When they have told us what should be done, when they have finished refashioning the world, and have put everything in its place, we might venture to ask them what would happen to the toy balloon. If the wistful demand was met with a look of contempt and a shrug of the shoulders, we could then turn away well satisfied, knowing that, whatever they were, they were not the prophets for us. Let them reform themselves, we would mutter as we passed out of their hearing."

He conveys the impression of the "unlovely signs of industry" in "A Coincidence" with as sure a touch as the impression he gives us of the fragrance of cherry blossom in his essay "In the Country." As a corrective to our modern outlook these essays are more valuable to us now than to a later generation who will appreciate them.

British War Memorial, Hankow. MR. HORACE G. TURNER, A.R.I.B.A., Architect.

[This design was selected in competition. The memorial is built entirely of granite on brick footings, and is supported on a lime concrete raft. The metal work is bronze entirely made by Chinese labour.]

NOTES ON SOME BUILDERS' WORKMEN IN THE MIDDLE AGES

By H. LITTLEHALES

In the following little article we have attempted to give a very brief notice of some of the workmen employed by builders in Mediæval England. The notes have been taken from original existing accounts set down by Mediæval builders, which may be seen to-day in the Public Record Office.

Caretakers.—This official is very rarely mentioned. He appears, however, in MS. 545–29 to have been paid 10d. a day, his business consisting in "rydyny and goyng for cartes"—that is, his occupation consisted in engaging carts to carry material.

Carvers.—Carvers apparently earned 8d. a day. (Records of a London City Church, E.E. Text Soc., p. 224.) In MS. 464–23 a carver was paid 10d. for working for two and a-half days, and for his "bord" for that time 5d. was paid. A little later on a carver is paid for making doors, windows and other necessaries.

Dawbers, Plasterers, Pargetters and Roughcasters.—It is probable that the Dawber, Plasterer and Pargetter all did very much the same work in the Middle Ages, the more expert workmen among them being probably employed to execute the more difficult and elaborate features. In MS. 474–12, the names plasterers and pargetters appear to be synonymous. We read:—"Item the plasterers hathe pargetted the gallery within and withoute." In MS. 477–12 plasterers receive 7d. a day; in MS. 499–19, the pargetters are paid at the rate of 6d. a day.

The following entry from MS. 504–2 shows us that the plasterer was at times employed in "lathyng" (which we may suppose to have been the work of nailing the laths) and in "dawbyng":—"Playsterers Workynge in the new lathyng, dawbyng and plasteryng ye walles of the said stabull, lathyng, dawbyng and plastering ye new partycion there, as also repayryng & newe lathyng & plasteryng of dyvers wales" [walls].

In another part of this MS. we read of the plasterers "daubinge and plasteringe with morter and here (hair) the walles," and in another part of the book they are paid for "lathyng and davbyng of dyuers selynges" and "whiting the walles."

In MS. 474–13 we read of a chamber being "new playstered with whytyng betwene the battens."

In MS. 489–7 dawbers received 4d. a day; in MS. 474–7 they received 6d. In MS. 489–6 we find an entry recording the payment of 4d. a day to each of two men "for makyng clay and dawbyng the bottre [buttery] flor & in the towre."

Rough Casters.—Rough casters are mentioned in MS. 474–12 as having harled part of a building.

Diggers.—In MS. 477–12 we see that chalk diggers received 6d. a day, and in MS. 499–19 "diggers of ston to the lyme kylle" are entered as receiving 4d. a day.

Hurdlers.—In MS. 465–20, we see that the hurdle makers or hurdlers helped to make scaffolds and ladders, and that they also mended hand and wheelbarrows. The hurdles were really a part of the scaffold, fixed, it is said, to prevent the men from falling. "Hurdles for the scaffold" and "scaffold hurdles" are often mentioned.

Keeper of the Storehouse.—This official is rarely mentioned in mediæval accounts. In MS. 504-2, however, we find one employed, Thomas Button, in 1544, being Keeper of the Storehouse, at a wage of 5d. a day. Later on, Robert Clodder held the post at the same wage in Button's place.

Lath Cleavers.—Lath cleavers are referred to in MS. 544–12. They were paid by the piece at 2d. a hundred.

Limeburners.—Limeburners appear to have been paid by the piece at 3½d. a quarter. In MS. 504-2, "Richard Louche," of Butcheworth, Heythe, "was paid xxs. for burning 20 quarters of lime, with the carriage, at 7d. the quarter." Stephen Parrat burned "clx quarters . . . iiii quarters to the c. [cwt.], at vs. the c. with the carriage."

Mortermen.—The morterman is rarely mentioned by mediæval builders, and the following reference from MS. 504–2 probably refers merely to men mixing and carrying mortar to masons and bricklayers. In this MS. we see that the mortermen were paid 5d. a day; their work for this payment is carefully described:—

"Mortermen, workinge in carringe of watter for to slacke lyme with, and castinge and sandinge the saide lyme and in seeftinge the saide lyme and sande, together with wateringe, workinge and chaffinge the saide lyme and sande into morter redey for the briklayers to worke with; and further more in workinge in seeftinge and makinge of morter for the breklyers and tylers to tyle with; and more in makinge of fyne morter for the said masons to sett the battelments with."

Painters.—Painters are not often mentioned in mediæval accounts. In MSS. 479–9–11, they were paid 8d. a day.

Pale Cleavers.—In MS. 545–29 the pale cleavers were paid 7d. a day for cleaving pales and rails for a fence.

Palers.—In MS. 545–29, we read of "palecleuers, palers and carpenters." The palers were paid 7d. a day for "raylyng and paylyng" a park. In MS. 465–20, they are paid by the price at 6d. a "rodde."

Paviors.—"Pavyours" were paid 6d. to 8d. a day (MS. 479–11, 489–7, 504–2). Sometimes, however, the pavior worked by the piece (MS. 489–10).

Quarrymen.—"Quarreers" were paid 6d. a day (MS. 499–19), but labourers at the quarry received only 4d.

Refiners.—"Fyners" were those by whom the lead was melted and cast into "sowes." Fyners are rarely mentioned, the probability being that in almost all cases such work was done by the plumbers. In MS. 504–2, two "fyners" were engaged, one, John Kenedey, at 10d. a day; the other, William Rabye, probably a labourer, at 5d. Both worked for nine days and cast in all eight sowes weighing "xxxii c. and xiiii li," (that is, 32 cwt. and 14 lbs.).

Servitors.—We are not able to explain the duties of a "servitor," and the mention of them in MS. 477–12 is, so far as we are aware, a solitary instance of the employment of men under such an appellation. We might suppose from the name itself that the servitor was a labourer, but we may feel sure that they were not simply labourers from the fact that the labourers employed on the same work at the time are entered in the ledger in such numbers as to amount to nearly a hundred; whilst the servitors were but three in all. Also labourers are classed *as* labourers quite separately to the Servitors. In the ledger in question, the servitors are entered as receiving 5d. a day, the same wage being paid to the labourers.

Shinglers.—Shinglers were not often employed. In MS. 504-2, they were paid 7d. and 8d. a day. The work of the shingler was to lay the shingles or wooden tiles as a roofing.

Slaters.—Slaters are commonly referred to in mediæval documents as "sclaters," though the term slater at times occurs. An instance of the name of the man being probably derived from his occupation (we meet with such instances more or less frequently in old accounts) is to be seen in MS. 488–22, where we read of wages being paid "To John Sclater, sclatyng and admendyng the rof."

The wage paid to the mediæval slater was commonly 6d. a day (MS. 499–19). Sometimes the sclater was known as a helyour, that is, coverer. The slater used "a picke off steele to make holes in sclate" (MS. 504–2).

Smiths.—The smith was not comm gaged at a daily wage, but in MSS. mention is made of "waiges" paid to In MS. 504-2, two smiths were employed day each "in taking of mesures and in attendance tyll the wyndowes myght be with mendyng and setting on of lock

Spoylers.—Spoylers were those by wood was cut up. They are not very fre mentioned. In MS. 499–19 spoylers a 4d. a day for "spowlyng" of wood lime kiln. In MS. 479–11 we find the "clevyng of wode" for the lime kiln. 546–5 we read of "ffellyng and sp tymber."

Thatchers.—Thatchers were paid 5d. (MS. 476–8).

Tilers.—For "drye leying" tiles, til paid 8d. the thousand. In MS. 544– were paid 7d. a day; in MS. 504–2, 7d. Apparently at times they fitted the lat which the tiles were laid. In MS. 50 read of "Tylers workinge as well v newe lathynge and tylinge of the said K On the same page we read of the tilers pinge, serchinge, lathinge and poynti

Wallers.—We meet with this name of at times, but it is probable that such pellation was merely a more expressive term for a mason or bricklayer. In MS wallers are paid at the rate of 6d. a day labourers "for makyng of morter and s the said wallers" received 4d. a da Wallers in MS. 476–8 are paid 11s. 8 wallinge of v roydes of walle with sto morter."

OBITUARY

The death occurred recently of Mr. John Snell, architect, of Plymouth. leaving school, Mr. Snell entered, in the office of Messrs. Damant & Reid. a preliminary period of five years, he three as an assistant, and in 1867 set practice on his own account. Among th notable buildings erected from his desi the South Devon and Cornwall Institut the Blind at Plymouth; the Sailors' F Devonport, Keyham, and Portsmouth Sailors' Home at Devonport; the Y buildings at Plymouth and St. Austel Royal Dockyard Orphanage at Dev the Nurses' Home at the Royal Albert H Devonport; Tavistock Urban District Offices; the north wing and hospital a College, Tavistock; Devonport Technical the Grand Theatre at Plymouth; Pl Co-operative Society's Central Stor offices; the Marine Biological Lab at Plymouth; Plymouth North-road Station; Lloyds Banks at Plymou Devonport; Barclays Bank at Ply the Midland Bank at Plymouth; street Higher Grade School and Hyd road School at Plymouth; St. M Church, Stonehouse; Wesley Chapel, Eb street, Plymouth; and the Baptist Ch Mutley, Plymouth.

Edgware Widening.

Church-lane, Edgware, and part o street are to be widened at a cost of mately £157,746.

Anglican Memorial in Flanders.

It is proposed to erect a chapel betw port of Ostend and Zeebrugge. This Memorial Chapel is intended to be a con landmark and to be, perhaps, the lar most beautiful chapel in Christendo western door, of British oak, will give on the level to a stately porch, with marble staircase leading to the chape vision will be made for chapels, where d at the entrance to the different sali which local committees may be forme small oratories will be built, at leas larger cemeteries.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers cannot accept responsibility for contributed , especially on legal matters.

we appeal to our correspondents to their queries on paper of a size easily and written as legibly as possible, or still, in typescript?—ED.

Distemper and Asphalte Mastic.

[REPLY TO "CITY."]

—Referring to the letter by "City" in ssue for August 29, "City" evidently price not quality. Either a poor quality tic was used or too much flux was added ke it easily worked), and the result was re so soft that the drip caused the ers." Such weak alkali (or acid) as would istemper could not affect the surface of roofing asphalte mastic, properly laid. lon. H. DARKE.

Mortar Pans.

—Whilst on holiday in Wales I noticed r smaller type of pan being used than is ly employed in this locality for mortar , and believe it to be known as a "loam It has one cogged and one plain runner elf-delivering door in the side of the pan. emed to me to be an advantage over the ype of mill with plain runners and the g done by shovel from the pan. Have aders any experience with the type of cribed, and could they put me in touch e makers? "HAMPSHIRE."

Elm Boarding.

[REPLY TO "BUILDER."]

—Elm boarding, particularly if cleft and n, will quickly assume the natural toned which your correspondent seems to be nt for, and no artificial means can better lting effect. The lime treatment which cribed in a recent letter in this column in ion with oak timbering is probably the fensive of these artifical means that ually be applied to elm weather boarding. "NATURE."

Efflorescence on Brickwork.

—Can you recommend any treatment for rescence on brickwork? My house was t year and was stopped by frost, and the something awful. The walls are 11 in. ad lustre bricks and there is a distinct re the job was stopped, above which no sign of the trouble. Would acetic ove it? I should be much obliged if d give me any advice.

H. C. RICHARDSON (A.R.I.B.A.).

Concrete Blocks v. Brickwork.

We find great differences of opinion uilders regarding the comparative cost ructing houses in these materials. y speaking, concrete block cavity walls aper than brick walls in the country. ndon, where 9 in. solid walls are usually tisfactory, the concrete blocks seem vour with builders and appear to save le in cost. The experiences of other surveyors and builders, with actual possible, would be very interesting. "SURVEYORS."

Right of Light.

an any reader inform me of any recog- hod of valuing the loss of light occa- the erection of a building obstructing ral light of existing premises? Are standard works on this subject? "SURVEYOR."

Rot in Woodwork.

[REPLY TO MR. J. J. JONES.]

SIR,—Once dry rot appears in woodwork there is no known method of checking the spreading thereof, other than by cutting out every part affected, and treating the surroundings with preventative measures, before renewing the woodwork. The parts cut out should be burnt, together with any soil under the floor where this trouble generally occurs, and the surrounding brickwork and timber should be coated with boiling tar or a cold solution of corrosive sublimate. The subject is dealt with exhaustively in a paper issued by the Royal Institute of British Architects. "W. G."

Cement Wash.

[REPLY TO "G.O.M."]

SIR,—An excellent wash for cement is made by mixing best quality Portland cement with a little plaster of Paris, say, one-tenth part, and about the same quantity of a high-grade glue. The Portland cement and plaster should be thoroughly mixed to the constituency of thin cream in a tub or other suitable vessel and the glue, melted separately, should be stirred together with a very little alum which will solidify the glue

Any earth colours which will withstand an alkaline action can be added, such as yellow and red ochres, Indian red and black; a very large number of pleasing buffs, creams, and light reds may be obtained.

Before the wash is applied the surface should be thoroughly cleaned down and soft wire brushes will be found of service in removing loose parts. It is exceedingly important that the Portland cement should have plenty of water to enable it to set hard, hence it is advisable to wet the surface before the wash is applied, which might be done with a hose or brushes. The work must not be done in the sun as the moisture would evaporate before the cement had time to set.

It is advisable to strain the wash before putting it on. ARTHUR S. JENNINGS.

External Oak.

SIR,—What is the best preservative in London? I want something transparent and practically invisible. "F. S. A."

A Legal Question.

[REPLY TO INQUIRER.]

SIR,—The proposals of your correspondent should be submitted afresh to the local authorities, whose professional advisers will examine them on their merits. The flat having been condemned unless certain steps are taken, cannot be re-let for human occupation until those steps have been taken, or the authorities have been satisfied that other equally sound measures have been tried. It would render the offender liable to very severe penalties if this is not done. "M. A."

Rust on Bricks.

SIR,—As a regular reader of your excellent journal, may I make a small inquiry? I am erecting a house faced with Crowborough bricks and find that many of them are issuing what appears to be a kind of brown rust residue. It is visible both when laid (in lime mortar) and when stacked in bolts on the ground. In my opinion it is due to excess of rain or moisture. I should be very much obliged if you or one of your readers could give me a satisfactory explanation of this, and will this so-called rust wear out or recede in time? Does any reader know the analysis of an average Crowborough facing brick? "PARKSIDE."

Boundary Walls.

[REPLY TO "BOUNDARY WALLS."]

SIR,—The deed plans of the dwelling houses should make it clear to whom the wall referred to belongs—probably to the owner of the dwelling houses—in which case the maintenance of the wall is his responsibility, unless neglect can be proved against the local authority in the disposal of surface water that may be damaging it. If the street was raised to the position shown after the erection of the wall, then there would be a just case for a claim upon the local authorities, or whoever is responsible for the upkeep of the street. If, on the other hand, the wall was built after the street, then the onus of constructing it in a manner that would withstand the reasonable wear and tear of its position rests with the owner. Damage by individuals is also for the owner to guard against, or take action against the individual concerned. The reversal of the levels does not appear to alter the case.

As regards sketch 2, it is a little difficult to advise without having seen the site, but for such a small job it would appear advisable to carry it out in brickwork—say, six rings of blue brick in cement, the abutments being cut away and rebuilt as far as necessary. In this way the outline of the old arch might be continued, and incorporated therewith, while an entirely different system might lead to a settlement in the road surface owing to differences in vibration. "Z. X."

SIR,—The first thing to decide, in this case, is the ownership of the wall. The deed should be inspected, and if a plan is given, it might decide the point at once; otherwise, the extremities of the wall in question should be examined, which should reveal evidence of ownership. If the wall is wholly on querist's ground, he would be liable to repair; but if it should prove to be a party fence wall, the expense of repair would be shared by the parties interested. It would be a help to know who originally constructed the wall.

A. SOUTH.

Laying of Bricks.

[REPLY TO MR. W. F. KENNELLY.]

SIR,—In referring to cavity walls, I had in mind what I consider the only genuine walls of this description, viz., those with a continuous cavity. These may be said to consist of two shells, one presented to the weather, and therefore liable to be damp, and the other within it, but with a minimum of specially designed connecting ties, to be kept bone dry. It is on the dry shell that the floor timbers at least should rest, if the danger of rot is to be avoided, so that it is the inner shell that supports the greater part of the weight of the superstructure.

Any system that interrupts the continuous cavity, either with piers or with through webs in the individual blocks, I do not consider as either effective or genuine cavity work, as the cavity becomes merely a means of saving material, rather than as a weather protector.

In any case, the wall referred to showed a continuous cavity in which it would be difficult to support the floor timbers on anything but the inner shell without a big outlay in the way of leadwork which would cancel the saving that was aimed at. "TRADITION."

Composition Floors.

[REPLY TO "KERB."]

SIR,—The floor referred to needs re-surfacing, and the layers thereof should be consulted in the matter. Once the hard outer surface of these floors is gone, there is really little or no wear left in them. The probability is that in cleaning the floors a lot of water has been used—a practice against which most makers give warning. Water rots the sawdust, and the floor crumbles.

Given a good make of floor, and a liberal use of good wax polish, the composition floor of to-day should have a long life. "PAVIOR."

Clay for Bricks.

SIR,—Could you tell me where I could get clay tested for brick-making?

THOS. GERMAN.

THE BUILDING TRADE

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., F.R.San.Inst. (Barrister-at-Law).

XIII.—VARIATIONS.—EXTRAS.—OMISSIONS.—DELAY IN COMPLETION.

VERY few works of any magnitude are carried to completion, in actual practice, without some deviation from the original plans and specification. Such variations usually include extras and omissions, and lead to questions of extra remuneration and extension of the contract period. Settlement is usually left to the final account, when, of course, the employer is inclined to concentrate on the contractor's charges for extra works, and the contractor on his loss of profit due to omissions. The office of the architect and surveyor is to see a fair and just finish.

Schedule of Prices.

The contract may state that all extra works are to be priced on the schedule of prices or at prices "analogous thereto," the latter to be decided by the architect or surveyor, who must consider fairly any arguments put forward by the contractor, make his decision, and certify accordingly.

Or, it may be left to the architect to fix a price on current rates—and in any case these must be reasonable and fair.

Contractor's Obligation or claim to Perform Extras.

In any case, a contractor is not entitled to refuse to perform extra works which are essential to the satisfactory completion of the work. But it is very usual to forestall any difficulty in this direction by defining in the contract the percentage and individual magnitude of extras and of omissions which can be ordered under the conditions of the contract, and beyond which limits, novation, or a new contract, must eventuate. This is to protect the contractor from being called upon to do a large amount of extra work at a loss; or of forfeiting an undue proportion of lucrative profits by omissions. Even an express stipulation for unlimited variations cannot operate oppressively *ad infinitum*.

On the other hand, there is no obligation on the part of the employer, unless so stipulated, to employ the general contractor to do extra works; though the latter can object to another being employed on the job, during the term of his own contract including the maintenance period, unless the employer has expressly reserved to himself the right to do so.

Written Instructions for Extra Work.

It is usually a condition that no work will be paid for as an extra except under the written order of the architect.

It would be well if, in every case of deviation or variation, a written order were first given by the architect, stating definitely if the work is extra to the contract. In this way the employer's interests are protected, and the contractor is not misled.

Where the written instruction of any agent is a condition precedent to payment, the extras so ordered must be within the scope of that agent's authority. See Forman *v.* The "Liddesdale" (1900) 69 L.J. P.C. 44.

Also the authority of the agent must be shown by the contractor seeking to recover remuneration therefor. See R. *v.* Peto (1826) 1 Y. & J. 37.

In the absence of such a stipulation, any substantial departure from the original plans and specification is a fertile cause of difficulty and dispute; and it would be better, in such an event, for all parties, that an entirely new contract be entered into. However, each party must then carefully watch his own interests, so that the new contract does not set aside his rights under the old, in any material point.

An employer is not liable for deviations involving extra work or cost, if undertaken on the contractor's own initiative. He may, however, become liable by ratifying such a deviation subsequently; but the mere taking and retaining possession of it does not render him liable to pay for it. Because, obviously, he cannot, alternatively, as in the case of a movable article, return any structure affixed to the freehold.

In a case where the contract made the written order of the architect a condition precedent to the payment for extra works, and where during construction, the employer had insisted on certain works being carried out, alleging that they were included in the contract, whilst the contractor maintained, whilst carrying them out, that they were extras and chargeable as such, and where no written order was given by the architect it was held that the arbitrator was justified in inferring an implied agreement by the employer to pay for these works as extras should he (the arbitrator) decide they were *not* included in the contract. See Molloy *v.* Liebe (1910) 102 L.T. 616 P.C.

Plant and Materials.

In general, if certain extras are found necessary for the satisfactory execution of the work contracted for in a lump sum, the contractor must perform them, and he cannot claim remuneration for the extra plant or materials. See Thorn *v.* London Corporation (1876) 1 A.C. 120.

Substitution of an Architect or Surveyor.

If, for any reason, an architect's connection with a job is severed, his successor accepts and is endowed with the full scope of responsibility and authority allotted to the original architect under the contract.

He cannot interfere with certificates or instructions already issued by his predecessor, but has full powers relating to subsequent certificates and the final settlement.

Also, if dispute arises between the two architects at the time of handing over, it would be for an agreed arbitrator to give a decision therein.

Statute of Frauds and Variations.

When a contract is in any category which the Statute of Frauds demands to be in writing, any variation must also be in writing; but similarly in any contract not so governed, variations may be carried out on verbal instructions.

Day Sheets and Extras.

In Myers *v.* Sarl (1860) 30 L.J. Q.B. 9, it was held that it is a usage of the building trade to charge these in a separate account, where they are capable of being measured.

In all the eventualities and similar disputes, an arbitrator or a jury would always consider the proportionate magnitude of any work disputed as an extra to the whole work. And it is clear that carefully prepared provisions and stipulations at the outset, followed by skilful and fair pricing, item by item, is the course most likely to reduce disputes to a minimum, and also to give least cause for anxiety to the contractor.

Date for Final Completion.

A date is usually fixed for final completion of the contractor's work, and he is entitled to the last hour of that day.

If no date is fixed, he must complete in a reasonable time, and be able to sho has used care and diligence, and s tools, etc., as are usual in simil takings.

Delay in Completion.

The condition as to the date of c with benefits or penalties agreed u be waived either expressly or imp or by the conduct of, the party enti sist on the condition; and a court will give relief to the other party on terms. The old rule that time is of t of the contract has been superseded, only where the parties have definite that time shall be of the essence of ticular contract, and where no other of the contract obviously render su dition ineffective. For example, w is also a clause providing for fines in of delay, or for extra works on wh sion of time would be claimable. then becomes evident that it is not that the work be completed at the A contract to erect a stand to view sion on a particular date would obvio time of the essence of such a contract the stand would be of no value afte cession had taken place. Also, tim of the essence of a contract when th subject to forfeiture if a building is n punctually.

Bad Weather.

Climatic conditions such as could have been foreseen and provided cannot be set up as a defence for d however, such unforeseen circumst damage by lightning or flood occur. contractor must show that he exer diligence in minimising the delay therefrom. Provision is usually ma tension of time at the discretion of tect in these events.

Otherwise, the principle holds that must perform any duty contracted any party is liable for damages ac the other party by reason of his dilat

Time is not Essential where Provisio for Delay.

It is to be noted that time ceases the essence of the contract when provisions for penalties, or liquidate for delay, or for extra works, etc., is overruled by an express condition shall not affect the stipulated dat pletion.

Town-Planning Institute.

The sixth annual country meeti Town-Planning Institute will take pla from October 9 to 12.

The following programme has been October 9: Delegates arrive. Oc Morning—Reception at the Council The President, Mr. W. T. Lancashir an address on the town-planning sch Leeds Corporation, followed by M Mattocks, who will give an address o of the joint town-planning committ noon—Visit to Middleton Housing Es road at Middleton, New-road betwe road and Gelderd-road, Ring-road fr hall-road to Swinnow-lane, Wythe Estate, Kirkstall Abbey and widening. Evening—Reception at Gallery. October 11.—Morning—Visi Newsam, then proceeding to Round after lunch proceed along the Ring Park-lane to Shadwell-lane, Ring- Harrogate-road to King-lane, th Meanwood Housing Estate to widening, and then *via* Weetwood-la Hollies," afterwards proceeding by lane to the Ring-road leading to October 12: A motor char-a-ba Bolton Abbey. October 13: Deleg

he congested areas, the industries
ed of housing accommodation for

In conclusion, the Garden Cities and Town-Planning Association, for the reasons mentioned, urge upon Parliament the desirability of the establishment of garden cities as a permanent means of dealing with the congestion in large towns and the resulting unhealthy housing conditions and obstacles to the efficient and healthy conduct of industry. They suggest the immediate setting up of a departmental committee for the purpose of advising the Government on the methods by which the policy can be carried into effect in the most expeditious and satisfactory manner. Such a committee would consider the nature of the central committee to be set up, the kind of organisation which would be required, the method of finance, and the provision of technical advice. It is believed that the policy enunciated will meet with support from the three great political parties of the State and is pre-eminently one which at the present juncture could be carried into effect with the goodwill of all sections of the community.

WOMEN'S INTERNATIONAL HOUSING CONGRESS

The Women's International Housing Congress was held at Caxton Hall recently, when delegates from many countries, including America, Austria, Czechoslovakia, Denmark, Germany, Great Britain, Sweden, and the British Overseas Dominions were present..

The chair was taken at the opening meeting by the President, the Marchioness of Aberdeen and Temair, who said she had had ample opportunity of hearing the bitter cry that was going up from women of all civilised countries as to the inadequacy of housing accommodation, and the consequent suffering and diseases and wastage of physical, moral, and spiritual life thereby entailed. The object of the Conference was to awaken generally their responsibility and power to make both municipal and national authorities feel that such a state of things could no longer be tolerated.

A discussion on "The Duty of the State and Local Authorities in regard to Housing and Town Planning Legislation and Administration" was opened by Mrs. Porter, during which Miss Alison Garland spoke of the shortage of skilled labour and the difficulty of obtaining men to build houses. She remarked, "If you clothe me suitably I will undertake to learn bricklaying in four months."

The afternoon sitting was presided over by Mrs. George Cadbury, when "The Standards of Design and Lay-out of new Housing Schemes" was the subject for discussion. The chairman said it would be a pity if anything were done to hinder private enterprise. A village which took from fifty to two hundred years to develop was the ideal to aim at. Housing committees should try to visualise the village as it would appear when completed. The case for regional planning was overwhelming. Speaking of Bournville, there were various undertakings, separate and distinct, but all conforming to a general scheme. It was a pioneer scheme, which had helped to raise the standard all over the country; even in the smallest houses bathrooms were provided. One of the public utility societies now at work was building by direct labour and sold its houses on a deferred payment system, and about 180 houses had been erected in that way. They had always stood for a sufficient number of bedrooms, although at the present time they were building twelve two-roomed houses for young married couples, and two-roomed bungalows for single women. Half the houses on the estate were built to let.

To ensure the maximum of light and air, Mrs. Aldridge suggested a system of windows which would slide into a cavity in the wall. She urged that as an amendment to the present Housing Bill the number of houses to the acre be included, to prevent slipping back to the old state of things.

Mrs. J. R. Clynes said Oldham had the most smoke-laden atmosphere of any town. She referred to the overcrowding everywhere, and especially to one parish in Paddington, where 2,500 people lived in 140 houses, and in many cases ten to twelve in two rooms.

A resolution was passed to the effect that the Congress was emphatically of opinion that it was desirable provision should be made in the Housing Bill for limiting the number of houses per acre to twelve in urban housing schemes, to eight in rural housing schemes, and four where there was no water supply or drainage system. It further desired to protest against the limitations of the maximum measurement prescribed under the financial resolution on the Housing Bill to 950 super ft. for the building of 2,500,000 houses providing homes for 12,500,000 people, and urged all Members of Parliament, irrespective of party, to secure amendment of that provision, leaving to the local authorities the task of determining what standards could best be adopted for their areas.

"The Establishment of Garden Cities and Satellite Towns" was discussed. In the opinion of Lady Emmott, the chairman of this meeting, the importance of extending the garden city movement was shown by the decrease in the death rate owing to the improved surroundings of the children. Delegates from Russia, Sweden and Berlin told of garden cities which were springing up in their own countries, and of encouragement given to the movement by their respective governments.

Later in the day Mrs. Fairfield said that the Southgate Urban District Council had supplied materials and houses had been built by "semi-direct labour." The cost of a house with three bedrooms, living-room, and sitting-room, including cost of land and drainage, was £550.

A resolution, which welcomed the achievement of the Ministry of Health in laying a housing scheme before the country, and urged members of all parties to support the Bill and any amendments that might be introduced to secure the highest possible standard of sanitation, convenience and beauty in the homes of the nation, was carried.

"The Work of Trained Women in the sphere of House Property Management" occupied the Congress on Friday morning. Mrs. W. A. Holman (N.S. Wales), who was in the chair, said she was tired of hearing the remark that such and such a job was not suitable for a woman. The whole point was, was the woman trained for the particular job? They had reached a stage, fortunately, where training could be obtained in any particular subject, and property management afforded a fine scope for women.

At the concluding meeting, Mrs. H. R. Aldridge said it had been decided to ask local authorities in every town and district to set up special committees with the aim of creating the requisite number of skilled apprentices in training, and to bring the number of workers in the industry up to the proper level.

Prices of Building Materials.

Sir Halford Mackinder, Chairman of the Inter-Departmental Committee appointed to survey the prices of building materials, in a report for the months of July and August to the Minister of Health and the President of the Board of Trade, issued as a White Paper, states that among the changes between June and July in eight districts an advance in the price of common bricks was reported ranging from 2s. 6d. to 5s. per 1,000. There was also a general reaction in the price of lead, which increased by amounts varying between £1 and £2 per ton. As regards changes between July and August, in most districts the increase in the price of lead continued, but otherwise there was no general change to which attention need be drawn.

Takoradi Harbour.

The tender of Sir Robert McAlpine & Sons, 50, Pall-mall, has been accepted by the Colonial Office for constructing Takoradi Harbour on the West Coast of Africa. The value of the contract is stated to be approximately £1,700,000 The total cost of the entire scheme will be about £2,500,000.

NEW INVENTIONS

The Economical Use of Bricks.

ONE among the many problems standing in the way of the building of houses is the shortage of bricks. One way out of the difficulty is to avoid the use of bricks in the construction of walls, and many ways of doing this are on trial, but it is evident that although alternative methods of construction will be used, large numbers of houses will be built of brick, and therefore any method of economising their use is of importance.

In modern cottages the hollow wall method of construction has been universally adopted. The "pier" system of construction, for which the Beaverhall Colour Co., Edinburgh, holds the patent, claims to obtain the advantages of the hollow wall with a saving of 40 per cent. of the bricks and cheaper and stronger construction. In place of the usual hollow wall a single 4½ in. wall is built with piers at intervals of two brick lengths. In this method of construction no novelty is claimed. It is in the isolation from damp of the inner wall, which may consist of breeze slabs or any cheap and convenient lining material, that novelty is claimed.

At intervals in the building of the pier, in place of a half brick, a brick about an inch longer is introduced, made of breeze and cement and dipped in boiling tar. To the faces of these bricks the inner lining is attached by spikes or nails, thus completely insulating it from damp coming through the brick piers. The arrangement of two brick lengths between each pier gives a good bond, and the stretchers can be run the whole length of the wall as in the ordinary bond.

The wall only requires to be plumbed on the outside, care being taken to measure the distance from the outer face of the wall to the inner face of the breeze wherever a tar brick is inserted. A floor plate laid along the piers carries the floor joists, and should be laid on the breeze brick so as to ensure insulation from damp. When cheapness of construction is required the space occupied by doors and windows should be in units of the pier construction. One advantage of the method is that it enables a variety of inner lining to be used, thus doing away with the necessity for plastering if a panel system of inner wall slabs is preferred.

Burglar Alarm.

The British "Burglarm" Bell Knob Co. of Skinnergate, Darlington, has placed upon the market a line of door furniture for the prevention of trespass. The chief points of advantage claimed by the "Burglarm" patents are :—

(1) The bell push is contained in the door knob; (2) using of letter box automatically rings the bell—no more delayed letters and papers; (3) turning of knob right or left gives warning of attempted entrance—this latter control can be switched on or off from inside door.

This new door furniture is in much demand for new houses, and the fact that it is simple and easy to fix to existing bell wires lends support to the claims of the patentee (Mr. A. E. Oates, of Darlington), for its widespread use for banks, offices, stores, hotels, &c.

Woodworking Machinery.

We have received from Messrs. A. Ransome & Co., particulars of a new registering and copying device for mortising and boring. It can be attached to any mortising and boring machine, which obviates the old method of setting out the mortises and holes on each individual piece of work. The device consists of a horizontal rod carrying two or more holders fitted with the registering pointers which can be instantly turned up out of the way when required. These are adjustable into any required position. The horizontal rod is kept in position by a spring in a vertical post which is adjustable in a socket on the end of a rod held in a lug screwed to the side of the machine or any other convenient position.

THE FACTORIES BILL

Factories Bill is a very comprehensive containing 143 clauses and four es; it repeals the Factories and Work- Act, 1901, and other Acts relating to and workshops and employment, erefore, is a consolidating Bill. We he late Government had in preparation aling with this subject, but we cannot much of the Bill introduced is the the present Government, or what have simply been adapted from any t by their predecessors.

ill deals in Part I with Health, in Part II fety, in Part III with Welfare. Part IV special provisions relating to all the ove headings; Part V deals with the ion and Investigation of Accidents lustrial Diseases; Part VI with the ment of Women, Young Persons and ; Part VII with special applications ensions; Part VIII with Home Work; with Piece-work and Wages; Part X, neous; Part XI, Administration; Part alties and Legal proceedings; Part XIII, tations; and Part XIV, Supplementary. of this description, which are amending, s consolidating Bills, it is a great con- when a marginal reference is given to ontained in existing statutes, as by that he new can be distinguished from the lation, but the Bill before us gives no istance, and as it repeals many Acts nds others (13 statutes are contained ird Schedule as thus affected), it would ult without exhaustive research to e precisely what are the new provisions d in the Bill. We are confining our- erefore to a brief notice of the Bill. provides, "Except where the contrary appears, the provisions of this Act ply to all factories, as defined by this nd considering the meticulous and legislation contained in this Bill. produced from other Acts, or introduced Bill, it would appear very important ecise definition should be given of what tory. We, therefore, turn to clause 136, I, "Interpretations," to ascertain what ctory."

as we can see, the distinction contained Act of 1901 between "textile" and xtile" factories has been abolished, old definition commenced by defining " and "non-textile" factories, and then that the word "factory" should ither of those descriptions of factories. nition in this Bill commences with what only of the paragraphs which formed the definition of a non-textile factory n 149, sub-section (1) (c) of the Act of ghtly amended. It provides, "Subject ovisions of this section, the expression includes any premises or place where- thin the close or curtilage or precincts , any person is employed in manual way of trade, or for purposes of gain, ntal to, any of the following purposes: (1) the making of any article, or of any article; (2) the altering, ornamenting, finishing, cleaning or or the breaking up or demolition rticle; or (3) the adapting for sale rticle; and to or over which pre- place the employer of the persons therein has the right of access or In the Act of 1901, this paragraph ly to premises wherein, or within the urtilage or precincts of which, steam, other mechanical power was used in e manufacturing process carried on he Bill then provides that "the ex- 'factory' also includes (without to the generality of the foregoing). under eight headings, certain pre- which specified processes are carried

s we can see at present, this definition e careful scrutiny when the Bill comes to be considered, for at first sight it appears far less definite than the definitions contained in the Act of 1901. That Act proceeded in section 149 in first defining "textile" factories where steam, water, or other mechanical power was used in certain defined processes. Then, "non-textile" factories were defined by reference (1) to certain places and processes named in the schedules, and (2) certain other premises and processes set out in the schedule, where mechanical power was used; then followed the more general provision set out above, which, as slightly amended, forms the leading definition in the Bill; but in the Act the operation of that provision was limited, as it applied only to premises where steam, water or other mechanical power was used; a limitation which does not appear in the Bill, but for which is substituted the limitation, "and to or over which premises or place the employer of the persons employed therein has the right of access or control."

To make the point clear, the present definition in this Bill of a "factory" includes "any premises or place wherein, or within the close, or curtilage, or precincts of which any person is employed in manual labour by way of trade, or for purposes of gain in, or incidental to, any of the following processes: (1) the making of any article or of part of any article, (2) the altering, repairing, ornamenting, finishing, cleaning or washing or the breaking up, or demolition of any article, (3) the adapting for sale of any article," and the only qualification is that the premises or place must be premises "to or over which the employer of the persons employed therein has the right of access or control." With the absence of the qualifications of the use of mechanical power on the premises, and exact definition of processes such as was contained in the Act of 1901, it appears to us that the question which will arise under this Bill is not "what is a factory?" but "what is not a factory?"

The definition is not confined to this clause, for, as we have shown above, in other sub-headings certain places and processes are set out which are to be included in the expression "factory," and then follow six clauses, some of which extend the operation of the definition, as, for instance, clause (2), which applies the Act to workplaces in which, with the permission of, or under agreement with, the owner or occupier, two or more persons carry on any work which would constitute the workplace a factory if the persons working therein were in the employment of the owner or occupier, and clause (5) which provides that a place or premises shall not be excluded from the definition of a factory by reason only that the place or premises are in the open air.

This question of definition affects the reasonableness, or the unreasonableness, of the whole Bill, for although the provisions it contains can reasonably be applied in large undertakings where machinery is employed and large numbers of workpeople are employed without seriously affecting the cost of production, that is not the case if they are applied to very small undertakings of what may be termed quite a homely nature where also they are not so necessary. Some clauses, it is true, are made only to apply where a certain number of workpeople are employed on the premises, but there are a great many provisions where no such qualifications occur, and thus, if we have read the definitions correctly, the provisions of this Bill will apply to small workshops where only a very few hands are employed on quite safe operations. The omission from the definition of the use of mechanical power, which, except in the case of certain processes or industries carefully prescribed, was contained in the Act of 1901, widens the scope of the Bill enormously; we do not propose to consider the Bill in detail in this first notice, but we may point out that building and engineering works are dealt with in clause 99, and the effect of that clause is as follows: The following provisions are to apply "to building operations and engineering works undertaken by way of trade or business, and to any line or siding which is used in connection therewith and is not part of a railway, subject to the modifications which are contained in this clause": (a) The provisions of Part I with respect to sanitary conveniences, (b) The provisions of Part II ("Safety") excepting those relating to vessels containing dangerous liquids, maintenance of passages and stairs, work in places where injurious fumes are liable to accumulate, steam receivers, compressed air receivers, self-acting machines, means of escape in case of fire, regulations as to means of escape from fire, and safety provisions in case of fire. (c) The provisions of Part III with respect to regulations for first aid and welfare orders. (d) The provisions of Part IV with respect to the regulations for safety and health. (e) Part V, that is, Notification and Investigation of Accidents and Industrial Diseases. (f) The provisions of Part IX with respect to weights and measures and weighing and measuring instruments used in ascertaining wages. (g) The provisions of Part X with respect to affixing an abstract, general registers, and duties of persons employed. (h) The provisions of Part XI with respect to the powers and duties of inspectors. (i) Part XII, that is, Penalties and Legal Proceedings. By subclause (2) The Notices of Accidents Act, 1894, shall not apply in the case of any accident in respect of which notice is required to be given under this clause, and if any question arises as to whether the notice ought to be given under that Act, or this Bill, the question shall be finally determined by the Secretary of State.

Under subclause (3) the provisions of this Bill in their application to "building operations and engineering works shall have effect as if reference to any place where the operations, or works, are carried on were substituted for references to factories, and references to the persons undertaking by way of their trade or business such operations and works were substituted for references to the occupier of a factory, and with such other necessary adaptations as may be prescribed: Provided that such of the provisions of this Bill as require general registers to be kept, and copies of the prescribed abstract and regulations to be kept posted up on the premises, shall be deemed to be complied with if the general register is kept at an office of the person undertaking the operations, or works, and copies of the abstract and regulations are kept posted up at each office, yard, or shop of the person undertaking the operations, or works, at which persons employed by him on the operations or works attend, and in a position where they can easily be read by such persons."

The provisions contained in this clause will require detailed examination in a subsequent article if the Bill proceeds. The corresponding section in the Act of 1901 relating to Buildings was section 105, and in that section the provisions of the Act only applied to premises on which machinery worked by steam, water, or other mechanical power was temporarily used for the purpose of the construction of a building, or any structural work in connection with a building, and to buildings exceeding a certain height.

By clause 137 "Building operation" means the construction, repair or alteration of a building, and the preparation for, and laying the foundation of, an intended building, but does not include any operation which is an "engineering work" within the meaning of the Bill.

"Engineering work" "means the construction of a railway, tramroad or tramway, and the construction, repair, or alteration of any harbour, dock, pier, inland navigation, tunnel, bridge, viaduct, sewer, gas work, water work, or other work authorised by any special Act or order having the force of an Act."

The above is only a very brief review of some of the provisions of this Bill, as there seems little prospect of its being proceeded with in the near future, but we may take this opportunity of expressing one warning as to all legislation of this character which aims at securing ideal conditions in the abstract, but is apt to overlook the general conditions under which trade has to be

carried on in the keenest competition with foreign markets.

The extension of what may be necessary protective legislation in large works, or in works where dangerous operations are carried out, is prohibitive to industry if unnecessarily extended to small undertakings and where safe operations alone are undertaken. Large works with considerable output may be able to bear the burden of increased expenditure made necessary by legislation, but to small undertakings such expenditure may well prove a prohibitive tax on home undertakings in the foreigners' favour. In all cases it increases the cost of production here, and the legislator's task is to discover the happy mean.

NEW BUILDINGS IN LONDON

Spring Gardens.—ART GALLERY.—The old County Hall in Spring Gardens will shortly be opened as an art gallery. The building is being converted at an approximate cost of £10,000. There is a circular hall, until two years ago the Council Chamber of the L.C.C., with a lofty ornamented roof. Opening out of the Council Chamber are smaller galleries, and altogether it is estimated that there will be accommodation for the hanging of about 500 or 600 pictures. In the outer galleries alterations are being made to give effect to the latest system of "top side" lighting. The old roofs are being removed, and these portions of the building are being rebuilt. Each outer gallery has had a new roof specially designed to suit its aspect and dimensions. The builders are Messrs. C. P. Roberts & Co., Ltd. The architects are Messrs. W. E. Riley and E. B. Glandfield, FF.R.I.B.A.

Paddington.—CEMETERY.—The Paddington Cemetery Committee recommend the Council to give authority for the purchase of Red Hill Farm, Edgware, at a cost of £24,500, for use as a cemetery. In their report, the committee state the approximate distance of the site from the nearest part of the borough is 5¼ miles by road. The committee estimate that expenses in connection with the purchase, erection of buildings, making of roads and paths, drainage, &c., will amount to £26,625, making the total cost of the proposed new cemetery, £74,252.

HOURS OF LABOUR IN THE BUILDING INDUSTRY

THE National Joint Emergency Committee of the building industry recently met in London with reference to the question of working hours in London. The official account of the negotiations states:—

A National Joint Emergency Commission, representative of the National Allied Building Trade Employers and the National Federation of Building Trade Operatives, was held in London, when the following decision was arrived at in reference to the summer working hours in the London district:

"This Commission, having considered the present difficulties on the application of the working rule agreement *re* hours of labour in the summer period in the London region, and having regard to the fact that meetings have been held in accordance with the provisions of the document of June 16 and no mutual agreement arrived at to depart from Clause 1 of the national working rule agreement, it is understood that the working hours in London during summer time shall be 46½, as provided for in the said working rule agreement, and the differences existing with regard to the method of working the 46½ hour week should be settled immediately and the same put into operation forthwith. In the event of these conditions being carried out the local inquiry and negotiation provided for in Clause 5 of the terms of settlement of the recent dispute to be proceeded with at once."

This report was signed on behalf of the employers by Mr. A. J. Forsdike and Mr. F. A. Wall, and on behalf of the operatives by Mr. Thomas Barron and Mr. R. Coppock.

RATES OF WAGES IN THE BUILDING TRA

The following are the rates of wages in the building trade in England and Wales. endeavour is made to ensure accuracy, but we cannot be responsible for errors that may oc

Number of houses approved by the Minister under section 3 and included in contracts	5,714
Total (included in Table 1) ..	115,523

3. BUILDING PROGRESS—at September 1st, 1924—

	Foundations completed.	Roofed in.	Total under construction.	Completed.
Schemes of local authorities	9,704..	7,224..	16,928..	8,566
Private enterprise	17,846..	15,750..	33,596..	17,781
Total houses (included in Table 2) ..	27,550..	22,974..	50,524..	26,347

NOTE.—Tables 1 and 3. For 42 local authorities from whom Returns for September 1st, 1924, have not yet been received, the numbers included above are taken from the previous month's Returns.

New Romford Institution.

The foundation stones were recently laid of the Romford Institution, in connection with the guardians' scheme for providing additional accommodation. The new buildings will cost approximately £100,000.

A Flint Chapel.

The chapel at Godsfield, New Alresford, Hants, has recently been scheduled for preservation as an ancient historical building. Built of flint, with ashlar dressings, it dates from about 1360.

British Commercial Gas Association.

The thirteenth annual conference of the British Commercial Gas Association is to be held in Liverpool under the Presidency of Alderman H. Wade Deacon, on September 29 and 30 and October 1. The speakers at the public conference on October 1 will include the Bishop of Liverpool, Dr. A. A. David, who will deliver an address on "The Worker and his Work"—human relations in an industrial age—and Sir Lawrence Weaver, K.B.E., Director of United Kingdom Exhibits at the British Empire Exhibition, who is to speak on "Art in Industry"—the influence of beauty in industry and commerce.

"Empire Forestry Journal."

We have received from the Empire Forestry Association, Imperial Institute, London, the July issue of the *Empire Forestry Journal*. It includes an interesting series of articles on the timber supplies of Burma, North America, and the Pacific Coast, together with an account of the lumber industry of British Columbia. Forestry in Tanganyika, South Africa and New Zealand is also dealt with, and an account is given of the Empire timbers at Wembley. Attention is called to a change in the by-laws, which enables members of the forest services of the Empire and others who make forestry their profession, to join the Empire Forestry Association as professional members, at an annual subscription of 10s. 6d., with all the privileges of membership.

PROPOSED NEW BUILDINGS & OTHER WORKS *

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ABERCARN.—The U.D.C. has approved of the Llanover Estate scheme for the erection of 600 houses. The scheme provides that the estate should build the houses.

ALVERSTOKE.—The B.G. proposes to carry out a scheme to include a laundry boiler and disinfector, and additional lavatory accommodation in the female ward of the House of Industry. The total cost will be about £5,000.

ASHTON-UNDER-LYNE.—The Recreation Grounds Committee of the T.C. have decided to apply to the M.H. for sanction to borrow £1,050 for the purchase and levelling of land in William-street, which it is proposed to use as a recreation ground.

AYLESBURY.—The T.C. has reserved two sites on the housing estate, one for the erection of an infants' school and another for the erection of a building for central day continuation and technical schools. Another hundred houses are to be built, and tenders have been accepted for 64 at £30,390, and 36 at £13,888. The B.S. has submitted plans of a scheme for sewage disposal, and been asked to prepare estimates as to cost. A refuse disposal scheme is under consideration.

BARNES.—Queen's Ride Bridge is to be repaired at a cost of £460. Plans passed: Nine houses, Stonehill-road, for Messrs. Rosevears, Ltd.; six houses, Nassau-road, for Mr. E. Broughton; house, Christchurch-road, for Mr. W. Burridge; 32 houses, Warren-avenue, for Barker's Estate; bungalow, Mortlake-road, for Mr. A. Dawkins; house, Sheen-drive, for Messrs. Crouch & Coupland; five houses, Stanley-road, for Mr. R. B. Rowell; film store, Station-road, for Mr. G. J. Viner.

BARNSLEY.—The Housing Committee recommends the purchase of 21 acres at Ardsley, and 2 acres at Carlton-lane, for housing schemes. Mr. C. Smith, the contractor for the Ardsley scheme, is to be asked to submit a price for the erection of 90 additional houses, and Messrs. Fairhurst Bros. to quote a price for erecting 50 houses. The Housing Committee recommends acceptance of the offer of the U.K.H. Syndicate, Ltd., to erect 50 cottages in pairs according to the Borough Engineer's plan, at £670 per pair. The Library Committee is in communication with the Carnegie Trust regarding a grant towards the cost of a new library.—Recreation rooms and playing fields situate near the garden suburb at Hollinwood are to be provided at an early date for the employees at the Woodpark Colliery and the Hollinwood Colliery. At a meeting of the Limehurst D.C. preliminary plans were approved of the scheme.—Plans passed by the T.C.: Two houses in Mount Vernon-road for Mr. D. R. Snowden; bungalow in Belgrave-road for Mr. H. Hibbert; two bungalows in Dodworth-road for Mr. F. Burkinshaw; warehouse in Windermere-road, for Mr. H. Ambler. Relief schemes proposed include concreting, kerbing, channelling and forming footpaths in a number of roads at an estimated aggregate cost of £5,366.

BLACKBURN.—Plans approved by T.C.: Bungalow, Pleckgate, for Mr. Edward Moorcroft; two houses, Lammack-road, for Mr. Gerald R. Clayton; two bungalows, Pleckgate, for Mr. S. T. Braidwood; bungalow, Fecitt Brow, Mr. John Brindle; four houses, Lynwood-road, Messrs. Penny Bros; two bungalows, Pleckgate, Messrs. E. Mercer & Sons.

BLACKPOOL.—The Housing Committee have decided to acquire a further site at Layton for the completion of the Corporation housing scheme in that district.

BLACKWOOD (MON).—The Miners' Welfare Council has taken control of the Blackwood Institute, and a permanent new structure is to be erected. Plans have been passed. This and other welfare projects in the district are estimated to cost, together, £27,000.

BOLTON.—The Committee of the Hulton Ward Labour Association have acquired a site in Ellesmere-road for proposed new club premises, plans for which have been submitted to the T.C. for approval.

BRADFORD.—Plans have been prepared for the erection of a warehouse in Wilton-street, for Messrs. J. Holmes & Co. Tenders for the building work are about to be invited by the architects, Messrs. Ross & Briggs, Bradford.

BRIGHTON.—The T.C. has completed the laying-out of two recreation grounds at Dyke-road and Lewes-road.

BRISTOL.—Estimates for new road works, brought before the Corporation by the Sanitary Committee, include: road, St. John's-lane to Parson-street, estimated cost, £17,250; road, Parson-street to Bedminster Down, £13,100; widening Parry's-lane, £21,180; widening Coombe-lane, Stoke-lane to Cross Elms, £3,720; road, Dingle-road to Coombe Dingle, £20,420; widening road opposite St. John's Schools, Durdham Down, £600; road, extension of Stoke Hill at Junction of Sea Mills-lane, £10,480; road, Hillfield-avenue to Midland-road, £1,360; road, Lodge Hill to Woodland Way, £4,260; extension and widening of Park-road, Shirehampton, £11,380; road and widening Gordon-road, Rose Green-road and Royate Hill, Fishponds, £48,910; widening Wick-road between Sandy Park-road and Sandbach-road, £1,500—total, £154,160. Other proposed works are to widen Netham road at a cost of £4,860.

BROMLEY.—Plans passed by T.C.: House, Quernmore-road, Kinnaird Park Estate Co.; two houses, Holligrave-road, Messrs. T. Crossley & Son; bungalow, Avondale-road, Mr. A. Frampton; house, Edward-road, Messrs. Oetzmann & Co.; sub-station, Madeira-avenue, Bromley Electric Light Co.; house, London-lane, Messrs. Perry Bros.; house, Park-grove, Mr. P. Coad; bungalow, Woodside-road, Mr. J. Ransom; two houses, Southlands.

BURNLEY.—The Corporation propose to acquire about 170 acres of land at Towneley for playing fields.—Plans passed by T.C.: Pair of houses in proposed street off Rosehill-road, Mr. L. Todd.

BURTON-ON-TRENT.—The T.C. has decided to build a covered-in annexe to the market hall. The cost is estimated at £1,700.

CARLISLE.—The T.C. has approved of plans for the erection of a new generating station, at an estimated cost of £233,882.—The Corporation is to widen and reconstruct the Caldew Bridge and St. Nicholas Bridge at a total expenditure of £108,500.

CARMARTHENSHIRE.—Grants have been made by M.T. as follows in connection with the C.C. roads improvements schemes: Llanelly-Carmarthen road widening, £3,500; Llanelly-Lougher road improvement, £6,000; Llanelly-Trimsarau road widening, £2,000, and for the Carmarthen-Newcastle Emlyn road improvement, £2,500. The County E.C. is to erect a new science laboratory at Carmarthen County School (estimated cost, £1,720) and is considering erection of additional scholars' accommodation at the school. The committee is also to erect a new gymnasium, a brick building, at Llanelly County School, at an estimated cost of £1,850. The erection of changing rooms and lavatory accommodation for the girls' department is also under consideration. The G.W.R. Co. has notified the Llanelly B.C. that a scheme for extensive additions and alterations to the railway station will be submitted to the Council for approval.

CAXTON.—Formal sanction has been received by the R.D.C. to the borrowing of £1,800 for the erection of four houses at Gamlingay.

CHATTERIS.—Plans passed by U.D.C.: Messrs. Shanks & Toms, for a building in London-road, for Mr. A. Curtis.

CLIPSTONE.—The Duke of Portland has given a sum of £1,000 towards defraying the cost of a parsonage for the new village of Clipstone, for which plans are now being prepared.

CLITHEROE.—The scheme for the erection of over 100 dwellings on the Goosebutts Estate of Clitheroe Corporation is likely to go on. The legal formalities are now in process of being carried through, and once they are completed Messrs. Moore, the Morecambe contractors, who are now developing the Pimlico-road district, intend to start work at once. The R.D.C. have decided that the new ferro-concrete bridge to be erected over the Ribble at Grindleton should be built opposite the bottom of Darkwood Brow. This will involve the construction of a new length of road on the Yorkshire side of the river at an additional cost of £1,000.

COSELEY.—Owners of premises in Woodsetton-road are making arrangements for sewer connections with the Sedgeley Council's system.

CROMPTON.—The D.C. have decided that the two plots of spare land on each side of Salts-street should be fenced and drained, and laid out as two separate playgrounds for boys and girls, and have instructed the Surveyor to prepare a scheme.

DISS.—Plans passed by U.D.C.: Building to be erected by the British Petroleum Co.

Webber; bungalow, Manor-road, for Mrs. Clara Martin; new road, sewer, shop, showrooms and offices, Winner-street, for Mr. S. Batten; five houses, Orient-road, for Messrs. Caunter Bros; bungalow, Goodrington Lane, for Messrs. C. & R. E. Drew.

PEMBROKESHIRE.—The Pembroke T.C. is to invite other authorities to join in soliciting the G.W.R. Co. to improve and make additions to Whitland railway station. The M.T. has agreed to make grant of £75,000 in connection with the reconstruction of the Haverfordwest-Fishguard road by the C.C. and local authorities.

PETERBOROUGH.—The City Engineer is to prepare a report on the decorative scheme for the Council Chamber at the Town Hall. The Milton Estate Office has had tenders for a new building, to be erected in Cathedral Gateway. A street widening is to be considered near the "Cherry Tree" Inn, on the Oundle-road. Thorpe Park and Church-lane are to be improved. The Town Clerk has been authorised to interview the Lord Bishop of Peterborough to ascertain his views with reference to a proposal to take over part of the Palace Gardens. Application is to be made for a grant towards the proposed widening of Narrow-street. Land in Star-road is being purchased for housing, and the City Engineer has been instructed to prepare plans for the erection of non-parlour houses. Modified plans are to be prepared for the erection of an infant welfare centre. Plans passed: Lecture room at St. Peter's College, for Dean and Chapter; house, Grange-road, for Mr. H. Maycock; bungalow, Fairfield-road, for Mr. Green; house, Gladstone-street, for Mr. A. Brown; house, Grange-road, for Mr. W. J. Mayes; house, Alexandra-road, for Mr. C. Barlow; house, Grange-road, for Mr. H. A. Sutton; two houses, Fairfield-road, for Messrs. Corner & Campion.

PONTEFRACT.—The Corporation's road works, as approved by the C.C. during the coming year, are as follows: Repairing Beastfair from Ropergate to Front-street with granite setts, £3,552; widening of Wakefield-road opposite Beechwood House from Shepherd's Farm to Priory-terrace, 420 yards, £1,235.

PORTSMOUTH.—The Markets Committee has been asked to consider the acquisition of the Oxford-street and Lake-road site for the purposes of an open market. The Tramways Committee has been asked to consider the abandonment of the proposal to extend the tramways, and to provide other travelling facilities. Permission is to be sought for a loan of £3,500 for reconditioning the Canoe Lake grounds, and £3,500 for reconditioning the Kingston recreation ground. Concrete steps are to be constructed on the esplanade, at a cost of £575. The B.E. has approved of the site for the northern secondary school for boys. The B.S. is to formulate a scheme for the northern end of Eastern-road to enter the Havant-road through Cosham. The Southern Railway has consented to the scheme for the widening of Fratton Bridge, estimated to cost £9,000. Sanction has been given for loan of £17,755 for works in connection with the lay-out of the first portion of the Southsea Common. Plans passed: Trustees, Congregational Church, Milton, Sunday school, Milton-road; Messrs. C. & F. Oliver, two houses, Empshott-road; Portsmouth Corporation Electricity Supply, transformer, Southampton-road, Cosham; Messrs. Fox & Smith, four houses, Kimbolton-road; Messrs. C. W. Stigant & Sons, 17 houses, Devonshire-avenue; R. J. Winnicott, eight houses, Thurbern-road; Messrs. J. J. Young, Ltd., rebuilding, "Electric Arms," beer-house, Fratton-road; C. W. Dye, private extension—road, Kirby-road; R. J. Winnicott, private extension—road, Thurbern-road; R. J. Winnicott, six houses, Devonshire-avenue.

PRUDHOE.—Plans approved by U.D.C.: Four semi-detached houses at Low Prudhoe, for Messrs. W. S. Allen, M. H. Armstrong, R. F. Fletcher, and W. F. Chapman.

RAMSBOTTOM.—Plans have been approved by the D.C. for the erection of four houses in one block in Longsight-road, Holcombe Brook, for Mr. J. Castle, and for the erection of a store room and grey room in Heywood-road, Holcombe Brook, for the Holcombe Brook Calico Printing Co.

REDCAR.—The T.C. has decided to erect a war memorial, to take the form of a monument. Consideration is being given to a proposal to carry out further extensions of the Coatham promenade.

RENFREWSHIRE.—Plans passed: Villa in Lethington-road, Whitecraigs, for Mr. J. Guthrie; villa in Lethington-road, for Mr. Alexander Fyffe; eight houses at Crookston-road, for the Govan District Board of Control; bungalow at Humbie Bridge, Mearns, for Mr. Wm. M'Mahon; 59 houses at Ormonde-avenue and Ormonde drive, Netherlee, Cathcart, for Messrs. John Dickie & Son; and bungalow at Uplawmuir, for Mrs. C. Allan.

RHONDDA.—The U.D.C. is to undertake considerable private street works at Tylorstown.

ROYSTON.—The U.D.C. have invited the authorities of the Aire and Calder Navigation Co., the M.T., and the West Riding C.C. to a joint conference to discuss the ways and means of the erection of a new bridge over the canal.

RUGELEY.—Tenders are to be obtained as soon as possible by the U.D.C.'s Surveyor for thirty parlour-type houses.

ST. GERMANS (CORNWALL).—A cottage for the district nurse is being erected on a suitable site in the village.

SANDWICH.—Plans passed by T.C.: House in Sandown-road, submitted by Mr. E. W. May for Mrs. H. M. Culpin; pavilion at Sir Roger Manwood's Grammar School, submitted by Messrs. Turner & Watts: three houses for Messrs. Hallett & Co., in St. George's-road.

SCARBOROUGH.—The principle has been approved by the T.C. of improvements at North Side, estimated to cost £14,700. These improvements are part of a much larger scheme for extending the Promenade by 400 ft., terracing cliffs, providing public shelters and lavatories, etc. Plans have been passed for extensions to a café at Peasholme, to cost about £7,500, and including a new building.—A contract has been "let" for the erection of a New Yorkshire Penny Bank in Huntress-row. Messrs. Wm. Nicholson & Sons, Ltd., of London and Leeds, are the contractors. Messrs. Chorley & Gribbon, architects, Park-place, Leeds.

SEAHOUSES (NORTHUMBERLAND).—It is proposed to erect a new Primitive Methodist Church at the Seahouses fishing station. Additional land has been secured for the purpose, and Sir Walter Runciman is giving £1,000 towards the cost of erection.

SEAHAM HARBOUR.—The U.D.C. has decided to proceed with the widening of Dawdon crossing, and to obtain an estimate for the widening of the railway bridge.

SEDGLEY.—At the U.D.C. the engineers for the Lower Gornal scheme for sewerage and sewage disposal submitted plans, the cost being estimated at £76,000. The scheme was approved, and the engineers, Messrs. Willcox & Raikes, were authorised to proceed with the preparation of quantities. The engineers also reported on a sewerage scheme for North Springfield, estimated to cost £1,000, and were authorised to prepare an estimate for the elimination of all surface water from the foul sewers on the housing estate. Plans have been passed for a slaughterhouse in Hill-street, for Mr. C. H. Guest. The Council has authorised the Surveyor to proceed with the lay-out of the extension to the cemetery at a cost of £740. The Town Clerk is negotiating with Lord Dudley regarding the widening of Cotwall End-road. Land is to be acquired to effect a widening of Bibdale Bank. A committee has been asked to report on extensions to the gas works, suggested by the gas manager, and involving an outlay of £14,300.

SHEFFIELD.—Plans approved by T.C.: Two houses Dalewood-road, for Gillam & Co.; four houses, Shiregreen-lane, for Mr. Ernest Reeder; bungalow, Dalewood-road, for Mr. A. S. Goodwin; house, Rockley-road, for Mr. Bernard F. Glossop; eight houses, Bents-road, for Mr. J. A. Wragg; four houses, Ringinglow-road, for Mr. Riley Watson; six houses, Ecclesall-road S. and Tullibardine-roads, for Mr. A. J. Belton; eight houses and shops, Ringinglow-road, Trap-lane, and Bents Green-road, for Messrs. W. Malthouse, Ltd.; bungalow, Dalewood-road, for Mr. J. V. Auckland; house, Bromwich-road, for Mr. C. Mitchell; two houses, Toftwood-road, for Mr. F. Hessey; bungalow, Carsick Hill-road, for Mr. W. W. Wood; five bungalows, Derbyshire-lane, for Mr. H. J. Taylor; two houses, Holmhirst-road, for Mr. H. Moulson; two bungalows, Watt-lane, for Mr. P. Parry; house, Stubbin-lane, Woodhouse, for Mr. E. E. Piper; house, Linscott-road, for Messrs. S. Higton & Sons; two houses, Snaithing-lane, for Mr. H. Tranter; house, Clarendon-road, for Mr. A. H. Cowan; house, Linaker-road, for Miss E. F. Judge; house, Whirlowdale-road, for Mr. C. Hodgkinson; house, Sefton-road, for Mr. A. Tyzack; two houses, Folds-crescent, for Messrs. C. Swift and C. B. Lowe; house, Gisborne-road, for Mr. W. Booker; two houses, Carter Knowle-road, for Messrs. F. Ridal & Son; two houses, Louth-road, for Messrs. Simpson Bros; bungalow, Cherry Bank-road, for Mr. E. C. Hannant; bungalow, Richmond-avenue, for Mr. J. L. Bostock; bungalow, off Richmond-road, for Mr. R. G. Redfern; two houses, Cairns-road, for Messrs. W. P. Cauwood and H. S. Harrop; two houses, Ford-road, for Mr. W. G. Porter and Messrs. Rawcliffe & Ogden; bungalow, Lees Hall-road, for Mr. J. C. Pimperton; two houses, Folds-crescent, for Messrs. Swift & Lowe; house, Whiteley-lane, for Mr. W. H. Bland; two houses, Louth-road, Messrs. Francis, the vicar of Gowertown; bungalow, Hendrefoilan-road, for Mr. A. G. Gugar; two houses, Tycoch Estate, for Mr. T. J. Williams; two houses, Pentregethen-road, for Mr. F. G. Rosser; bungalow, Mayals, for Mr. Wm. Perry; two houses off Coed Cely-road, Derwen Fawr, for Mr. G. Stringer; two houses, Carmarthen-road, for Mr. Griffith John; bungalows, Ravenhill-road, for Mr. Harry Hocknell; two houses, Cecil-street, for Mr. Wm. Samuel; house, Oystermouth-road, for Miss Parkinson; house, Pwll-street, for Mr. D. J. Harries; two houses, Tycoch-road, for Mr. W. T. Humphreys; house, Middle-road, for Mr. L. C. Morgan; house, St. John's-road, for Mr. W. J. Jones; house, Waun Wen-road, for Mr. J. A. Myles; bungalow, Tycoch Estate, for Mr. F. R. Miller; house, Tycoch Estate, for Mr. L. C. Shaughnessy; house, Mysydd-terrace, for Messrs. Richard & Matthews; bungalow, Bayswater-road, for Mr. D. A. Williams; house, Monterey-street, for Mr. F. S. Nicholas; house, Oystermouth-road, Blackpill, for Mrs. A. L. L. Jones; house, Oystermouth-road, Blackpill, for Mrs. C. E. Grove; bungalow, Bayswater-road, for Mr. D. A. Williams; two houses, Middle-road, for Mr. J. Ll. Davies; two houses, Cwmgwyn Estate, for Messrs. T. & G. Spragg; house, Goitre-fach-road, Killay, for Mr. D. E. Sandy; house, Pinewood-road, for Mr. J. R. Cheley; house, Tycoch Estate, for Mr. Thos. Evans; house, Tycoch Estate, for Mr. T. C. Hughes; two houses, Tycoch Estate, for Mr. L. Lloyd; bungalow, Pentregethin-road, for Mr. D. Jonah; house, Lucas-road, Glais, for Mr. S. Edmunds; two houses, Aberdy-berthi-street, for Mr. J. O. Watkins; two houses, Belle-Vue-road, for Mr. P. J. Haywood; house, Lime-kiln-road, for Mr. B. F. Hoppe; house, Manselton-road, for Mr. T. L. Norman; two houses, Prospect-place, Sketty, for Mr. G. R. Thomas; house, off Aberdy-berthi-street, for Mr. S. Govier; two houses, Bellevue-road, for Mr. W. S. Davies; house, Gower-road, for Mr. J. C. Croocock; two houses, Cwmgwyn Estate, for Messrs. T. & G. Spragg; two houses, Slade-road, Newton, for Messrs. Howell & Michael; three houses, West Cross-lane, for Mr. F. E. A. Beer; bungalow, New-road to Waunarlwydd, for Mrs. Norton; house, Caswell-road, for Mr. W. D. Hughes; two houses, Glanbrydan-avenue, for Mr. C. H. Cousins; house, Pentregethin-road, for Mr. T. J. Hughes.

THORNABY-ON-TEES.—A new public elementary school, to accommodate 300 children, is proposed by the North Riding E.C.

TORQUAY.—The T.C. has expressed favour of a scheme prepared by Messrs. Watson for improving the entrance to the Imperial Hotel, and considers that the time has arrived to re-open the scheme for the proposed widening and improvements to the entrance to the marina on the Beacon Hill, and that the final consideration of the two schemes should be taken together. A special committee has been formed to consider schemes prepared by the Surveyor for street widenings.

TREGARON.—The C.C.s of Brecon and Cardigan, with the R.D.C.s of Cardigan, Tregaron and Builth, the Llanwyrtyd Wells U.D.C. and other local authorities, are preparing a joint scheme for construction of a new road, Tregaron to Abergwessin.

TRURO.—The City Surveyor has been instructed to prepare plans for utilising the lower portion of the Hendra site for houses. Messrs. Thornley & Rooke, of Plymouth, architects for the Civic Hall, have been asked to get tenders for the scheme as soon as possible, the M.H. having sanctioned a loan of £6,000 for the purpose. The site of Nos. 2 and 3, Clement-street is to be cleared and the Surveyor asked to prepare plans for the erection of two houses. Plans passed: Bungalow, Faniell-road, for Mr. Bennett.

WARWICK.—The M.H. has sanctioned the proposal of the T.C. to erect a further 41 houses on the Emscote site, and tenders are now to be invited. The B.S. has been instructed to proceed with the scheme for the widening of Swan-street.

WELWYN.—Garden City Parochial Committee has decided to let the contract for its proposed 200 new houses as a whole.

WIGAN.—The managers of the Sacred Heart, Springfield, R.C. School, are proposing enlarging the school premises to provide additional accommodation for 120 scholars.

WINCHESTER.—Plans passed by the R.D.C.: House, Shawford, H. G. Courtney; cottage, Hookpit, E. C. Green; shop, Easton, E. Clark; bungalow, Michel-dever, A. Edwards; cottage, Fair Oak, Mrs. Treasure.

WOODFORD.—The U.D.C. has passed plans as follows: 4 houses, King's-avenue; house, Horn-lane, and house Mankham-avenue.

YORK.—The City Council has under consideration the desirability of erecting cottages on the hospital lands, for the accommodation of members of the staff. It is suggested that accommodation for mental defectives could conveniently be provided at the City Mental Hospital.

FIRE.

Damage to the extent of between £15,000 and £20,000 was done at a fire which occurred recently on the premises of Messrs. James Burn & Co., Ltd., wholesale publishers and bookbinders, Kirby-street, Hatton-garden.

TRADE NEWS

Economical methods of obtaining satisfactory finishes of all kinds of woodwork are thoroughly dealt with in a booklet of 32 pp., illustrated throughout in colour, issued by Messrs. S. C. Johnson & Son, Ltd., of West Drayton, Middlesex. Among a large variety of treatments for wood surfaces considered are dyes which give an attractive appearance to soft woods in cases where the question of cost does not permit the use of expensive grained hardwoods; flat varnish stains for covering up old work; paste wood fillers and wax in a variety of shades for floors; prepared wax for polishing finished surfaces; powdered wax for dance floors; undercoats; enamels which are claimed to cover from 300 to 500 sq. ft. per gallon; preparations for removing old paint and varnish; and washable wall finishes in different colours. In addition to text illustrations, 3 pp. are devoted to 60 colour panels showing the actual results obtained with the firm's products. Copies of the booklet will be sent free on request.

Those of us who have admired the beautiful woodwork to be seen in the India and Burma forestry and timber exhibits at the British Empire Exhibition will welcome the publication of a catalogue of these sections. Such a volume, running into 140 pp., has been issued by Messrs. W. W. Howard Bros., & Co. (sole agents for the Governments of India, Burma, Bombay, Madras, and Western Australia), of 4, Stanhope-street, Euston-road, N.W.1.

The Cheltenham Shop Fitting Co. have found it necessary, owing to increased business, to remove to larger premises, and their address is now Station Works, Cheltenham. The new premises comprise large and well-fitted workshops, draughtsmen's offices, showrooms, polishing shops, etc., and some of the latest and best machinery has already been installed, with further additions to be made in the near future.

Councillor's Resignation.

At a meeting of the Bromsgrove Urban Council, a letter was received from Mr. John Brazier, of the firm of J. & A. Brazier, builders, Bromsgrove, stating that, owing to the recent decision of the late Mr. Justice Bailhache, he felt bound to resign his seat on the Council. The Council decided to accept the resignation with regret, and to express to Mr. Brazier appreciation of his services, coupled with the hope that he would be able to return to the Council at a later date. The firm of which Mr. Brazier is a director are the provisional contractors for the erection of a new market hall for the town, and for a number of Council houses.

TENDERS.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VII.—No. 4260. SEPTEMBER 26, 1924.

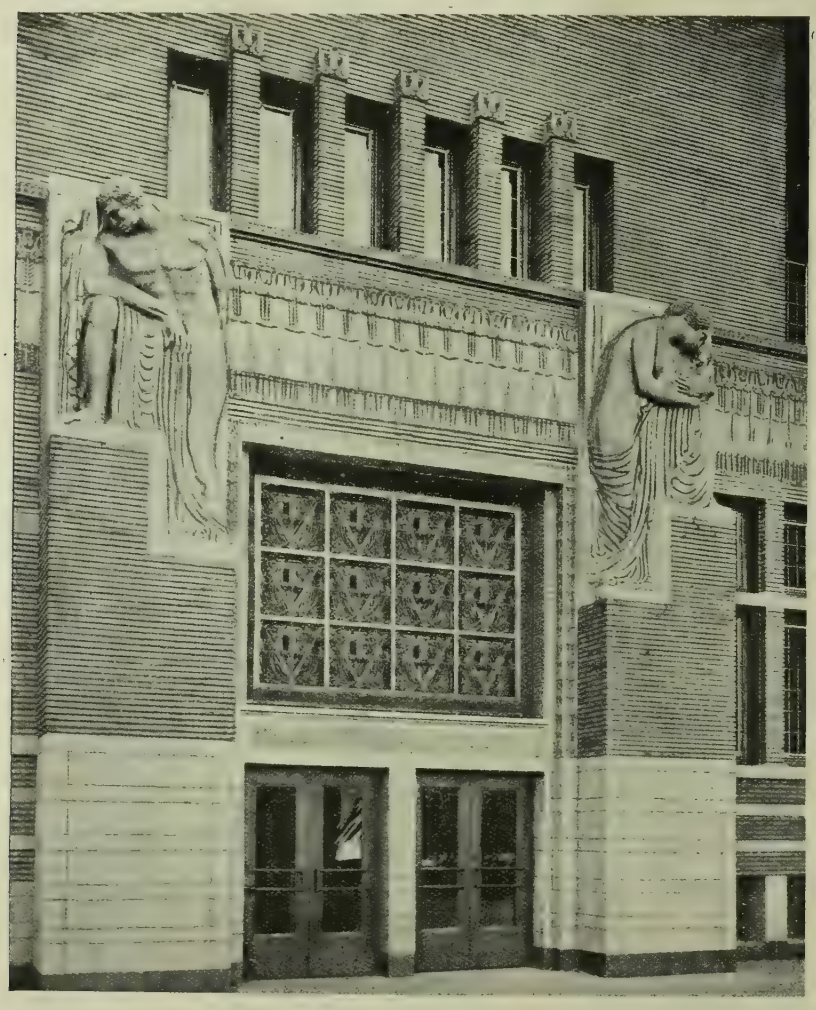
HOUSING

THE figures recently given by the Ministry of Health relating to housing schemes under the Chamberlain Act of 1923, which we published in our issue for September 19, appear to raise the question whether the policy embodied in the Act of this year of favouring the local ities more than private enterprise in the amount of the bution or subsidy is a wise one. Table I gives the number ses authorised up to September 3, and the figures are : s to be erected by local authorities, 55,286 ; houses to be l by private enterprise, 103,233. Table III, which is l "Building Progress," gives the number of houses under uction : By local authorities, 16,928 ; by private enter- 33,596. In fairness it must be pointed out that in a note se tables it is stated that returns had not been received 12 local authorities for September, and that in the case se local authorities the numbers had been taken from the s of the previous month, but it is still worth noting that mber of houses authorised and under construction by e enterprise were nearly double the number given for local ities. Under this Act both private enterprise and the uthorities, so far as the State contribution or subsidy cerned, are in a position of equality, and under such ons private enterprise has given about double the output ses. If we may use a simile, the policy of favouring the uthorities appears akin to what would have been the of a Government who in past times had elected to se horse traffic to the disadvantage of motor traffic, nce being given to the slower method of progression.

e Government, however, concedes the fact that private ise produces houses, but alleges that the houses so ed do not meet the present need for working-class gs, as they are sold and are not offered on weekly ents. Mr. Wheatley, in a recent article in the *Operative* , has again emphasised this point, as he says : "The 1923 was producing houses, but not enough to ease the n, and the houses were mostly being built for sale and letting, so that those very people whose needs it was to meet were not being helped." A correspondent, in we published in our issue of June 6, went further than he stated that "Working-class dwellings never have pplied by private enterprise and with much stronger cannot be supplied now without assistance from the

We cannot but think that this statement goes too far, re are working-class buildings erected expressly for the g-classes in every industrial town in the country which ected by private enterprise, and although of late years, ly since the war, there has been considerable conversion e houses in neighbourhoods which have changed in er, we hardly think it could be proved that until com- ely recent times the bulk of the working-classes were sed in houses erected by private enterprise.

his as it may, the figures published by the Ministry of as to the numbers of houses now being produced whilst thorities and private enterprise stand practically on an ooting as regards subsidy, coupled with the statement ose erected by private enterprise are only sold, and not very suggestive, as it would appear that the real problem lved is why private owners will not let the houses which n produce twice as quickly as the local authorities have It will also be very interesting to watch the results of the p which the present Government has instituted. The ion to houses being offered on lease or let on weekly agreements is rent restriction, and the nation is now being called upon to subsidise housing because for many years an economic rent has not been permitted. The Clydebank dispute in itself serves as an object lesson as to what restriction in rent may lead to, especially in the case of weekly tenancies to the poorer classes, and with that example before their eyes private owners hesitate to let the houses which they erect. Rent restriction is founded on a radically wrong principle, as it makes the private owner of one class of property alone contribute to the national necessity. For ten years the private owners of certain classes of houses have been called upon to pay a subsidy towards housing levied on their property alone, and having thus paid a tax or rate levied upon no other class, they are still left with this burden upon them, whilst an additional subsidy is offered to the local authorities in order to induce them to undertake the work that the private owners are prevented from carrying out.



Since it is proved, other things being equal, that private enterprise supplies twice as many houses as the local authorities, the solution of the housing question appears not to lie in increasing the subsidies unequally between the two agencies for supply, to the detriment of the most productive, but to inquire carefully whether steps can be taken to encourage private enterprise not only to erect houses but to let them when erected. This is a very thorny subject and requires approaching with the greatest caution. There is strong opposition to the immediate repeal of the Rent Acts, and although we cannot follow the argument in the letter by the correspondent we have already referred to, that it would be unfair to those who went to the war placing them at a disadvantage with the "stay-at-home," seeing that the real effect would be to place the stay-at-home on an equality with those who served instead of being "preferential" householders as they are under rent restriction, we are content to leave the matter there in this article, which is not so much addressed to the subject of repeal of the Rent Acts as to securing the increase of housing accommodation which will be let to small tenants. Our correspondent agreed with us that the payment of subsidies is a wrong method, and puts the point tersely, saying that generally it is an encouragement to extravagance and unfair inflation of prices, but the nation stands now committed to vast subsidies and is backing the slowest horse, the local authority. If a subsidy has to be paid, is it being spent to obtain the best result ? Would not a less sum than that now proposed to be spent in subsidies be expended if the Rent Acts were repealed and necessitous tenants assisted ?

We made some such suggestion tentatively in our issue of May 23, and our correspondent in the letter we have referred to characterised the policy as "stark staring daylight madness," and thought it would lead to profiteering on the part of those who had bought property at low prices, but although we deprecate assistance being given through the rates, we may remind ourselves there is some precedent for such assistance being given in section 5 subsection (1) (*c*) of the Housing Act, 1923, in the case of converted houses, and possibly some such method of assisting tenants might be devised. We only desire to show that there is need for inquiry whether the best method of securing houses quickly is embodied in the new Act, which favours local authorities more than private enterprise, or whether a more economic means might not be devised which would accelerate output and at the same time do something towards restoring economic rents.

NOTES.

The Influence of Ruskin. It is probably impossible even now fully and justly to estimate the amount or the value and influence of Ruskin's writings. In its sociological aspect one can hardly doubt the value of his insight and sympathy. In its critical artistic aspect much exception might be taken; it would be quite impossible for us all to follow him in his extreme laudation of Turner. In its relation to architecture it has become the fashion to underrate much of his writing, but we think our readers will agree that in his very interesting paper on "The Architect's Debt to Ruskin" Mr. Halsey Ricardo has done no less than justice to Ruskin's wise prevision as to church restoration, and shows that he was actually a pioneer in regard to matters which signify much to architects to-day. Elsewhere in this issue will be found the paper in question.

Housing and Labour. We must all agree that a broader vision has been brought to bear upon many of our present-day problems during the past fifty years. The increased generosity of view which makes it desirable to realise the hopes and fears of the manual labourer is a distinct advance in modern civilisation. But real statesmanship should be the guide in national affairs, and that is bound to take cognisance of all the needs of all classes. There is much to commend in the efforts of the National Federation of Building Trade Operatives to make things easier and fairer for its members. But we have to face many hard facts in these tax-ridden days, and whilst we must give a sympathetic ear to the sociologist and philanthropist, we cannot afford to ignore the economist or the statesman if the greatest good is to be assured to the country. It is not a fact that the "new earth" is a something which "plain men alone can produce," if it is the generally accepted meaning of plain. Nor will there be felt general confidence in the statement of the Federation that they "are both able and willing to build houses with or without the intervention of the employers." We welcome all fair and simple statements, but we cannot see that the way out of our many difficulties is to be found without full consideration of our economic and practical difficulties side by side with the vital interests of manual labour and non-manual labour. We must not forget that brain is at least equal to brawn and and we cannot reckon without it.

Woodbury County Court House: Side Entrance. (*See page* 472.)
MR. WILLIAM L. STEELE, Architect; MESSRS. PURCELL & ELMSLIE, Associated Architects.

Architects' Benevolent Society's Insurance Scheme. We have received a the Architects' Ben Society's Insurance which, we understa been sent to every of the architectural profession. Th let contains full particulars of the tects' Benevolent Society's In Scheme, from which we learn an architect has to do, whatev of insurance he may require, is t to the Architects' Benevolent The Architects' Benevolent Society tied in any way to any insuranc pany. Each architect who insures to choose his own office, but if he preference he can leave it to the to recommend an office where th of policy he requires will be and advantageously carried throu architects insure through a central which is at the same time a society entire income is expended on t fortunate members of the archit profession, they have the satisfact knowing that the commission w attached to the transaction, and is paid to the Architects' Bene Society, is returned by the Society architectural profession in the fo grants and pensions to "those in n tous circumstances who have been e as architects or architects' assistan to their widows and children." is an aspect of the scheme which, it has only to be realised to appeal architects who care for the solida their profession, and we gladl attention to a very simple way in the Society can be assisted.

Workmen in the Building Trade. We are glad to n the current issue R.I.B.A. *Journal* th Committee appoint the Institute to into the shortage of skilled w in the building industry has been a on the question for some month hopes to be in a position to lay it before the Ministry of Health early date. Their views should special interest at the present tim we hope they will have some suggestions to put before the M Wages are standardised, there is pl work, and yet, with large numbers employed workmen, many of them trained, we find this serious shor labour.

Mural Decoration. We are glad to notic in no way depress recent failures i attempt to revive painting, a scheme of decoration h recently carried out in the Memori of the Highway Clubs (Incorporat two students of the Slade School un

Mr. W. John Allcorn.

Sheldonian Theatre, Oxford.
nowing the President of the R.I.B.A.)

ion of Professor Tonks. From ductions of them appearing in a con- prary they appear to be executed much ability. Perhaps it is hardly ble to speak of such work as executed udents, as the handling shows con- ble experience; however, as the ages e artists are given as 19 years only, evidence of great promise for their e careers. The two students execut- ese paintings are Mr. Rex Whistler liss Adshead, a daughter of Professor ad, the Professor of Town Planning, n University. We shall be inter- to learn whether these paintings, are executed in oil, were carried out e wall itself—the essential require- of mural decoration—or whether re that studio substitute over which ch talent wastes itself. A real l of mural decoration will only be ed when the methods are those properly belong to the art. The measure about 7½ ft. by 10 ft. It something of an achievement if the ration of two artists in this way has ded in obtaining a unity in their which from the reproduction we een appears to be the case. Every agement should be given to work character, and the two students ve executed these paintings are to ngratulated on the vivacity and ce of their work. We like to hear arts finding a home in Shadwell, there is perhaps as genuine an iation of beauty as in more favoured ourhoods.

---

aling ement.

For whatever reasons—probably more than one—we are very glad to notice, in reference to the note on bject in our last week's issue, that ge mirrors disfigured by advertise- which were placed recently on the en at Ealing have been removed. uncil is to be commended for its support of the amenities of the locality in deciding to remove them. We feel sure that many others besides ourselves felt the unsuitableness of introducing ugly advertisements on ground belonging to the public, and this aggression was a very flagrant one. It is a pleasure therefore to be able to state that wiser counsels have prevailed and that the attractive old green is freed from this violation of its old-world quiet.

Commercial Education.

We are glad the Royal Society of Arts is calling attention to the advantages offered by the London County Council for commercial education in their evening classes and the examination organised by the Society. It is to everyone's interest that students should take the fullest advantage of the educational opportunities offered, and it is to be hoped that our commercial houses will do all they can to encourage the attendance at these schools and examinations, for in these strenuous times we must aim at the most thorough-going efficiency.

Pictures and Sculpture.

An interesting exhibition is that of the New Forest group at the Mansard Galleries, and many admirable pieces of sculpture add much to the value. Mrs. Phœbe Stabler and Messrs. Hesketh Hubbard and Armfield have specially good subjects. Two or three of the landscapes reach a quite high level of attainment. The serene and quiet charm of some of our old English water-colour painters would be a welcome addition to the skill of our modern artists.

The Making of Pictures.

Whilst so much really excellent work is being done it is a pity that space is found for what can neither elevate nor amuse. One of the exhibitions now open is typical of the futility of much modern art. We looked carefully over every exhibit in this collection and could not find out any reason for their existence. It is a curious thing that anyone should be ready either to produce or exhibit works so completely lacking in any real artistic value.

Building Materials.

The Committee which has been appointed by the Minister of Health to report as to materials and methods of construction available for the building of houses for the working classes have a wide field for their inquiries. It would appear, however, that apart from the advantage of different localities for the supply of particular materials, there is not much difference of cost between them all. We think the use of wood as a building material has greater claims than one generally allowed to it, and we should like to see some building done on the lines of the Essex and Kent weather-boarded buildings. The risk of fire has not been established as much if at all greater than other materials. Nor should the consideration of the material to be used be wholly utilitarian. Certain localities have already been defaced owing to the alien material used for housing schemes, forming so great a contrast to the buildings already existing as to create a very unsightly effect. We cannot altogether ignore considerations which affect so much the result of what is done. Concrete has the advantage that it can be adapted to take a local character in its form, and should in the hands of good architects be made to conform to local characteristics. In any case, it is more a matter of locality than price as between different materials, and what we do want to see combined with due economy is some sensibility of the fitness of what is built, that it shall add to and not disfigure the existing amenities of the localities in which it is placed.

GENERAL NEWS

Professional Announcement.

Mr. Walter Dewes, architect and surveyor, has removed his offices from 4, Bloomsbury-place, W.C.1, to 37, Bedford-row, W.C.1. Telephone: Chancery 7512.

Mural Decoration.

At the Memorial Club, Shadwell, a successful experiment in mural decoration has recently been carried out by Miss Adshead (daughter of Professor Adshead, Professor of Town Planning, London University) and Mr. Rex Whistler, under the direction of Professor Tonks. Five bays in all have been decorated.

Oxford Society for the Blind.

On September 29 Mr. Herbert A. Cox will lecture on "Old London," in the Holywell Music Room, Oxford. The chair will be taken by the Rev. T. W. L. Caspersz, Rector of Crowmarsh. The lecture will be illustrated by lantern slides and a model of "Old St. Paul's" will be exhibited.

Bartlett School of Architecture.

On September 29–30 (10 a.m. to 1 p.m.) students of the Bartlett School of Architecture will be received by the Provost, Professor Richardson, and the Tutor to architecture students. On October 1, at 5.45 p.m., the students of the evening courses in Architectural Design, and of the Architecture Atelier, will assemble.

The Earliest Architecture.

The Tomb Chapels, which have recently been unearthed by the Department of Antiquities, are, it is claimed, the earliest surviving stone buildings in Egypt, and therefore in the world, having been built at the very least in 3000 B.C. according to the so-called short chronology, but many archæologists are prepared to give them 1,500 years earlier. The discovery, it is stated, will involve the re-writing of the first chapter of the history of architecture.

The Institute of Builders.

The next Licentiate examination of the Institute of Builders will be held about the third week in May, 1925. The fee for the examination will be £1 1s. Applications should be sent in not later than February 1. Syllabuses containing application forms can be obtained from the office of the Institute of Builders. Specimen sets of Licentiate papers with drawings are also obtainable at a charge of 5s. a set.

Leiston War Memorial.

A memorial chapel was recently dedicated at Leiston, Suffolk. The chapel is built of flint and granolithic stone, with a red tiled roof, and copper bell turret at the west end. It is in the Early English style of architecture, and consists of a nave, small chapel and vestry, the design of Mr. J. A. Sherman, architect, Ipswich. The memorial tablet, of white marble, on which are inscribed the 122 names of the fallen, was carried out by Messrs. Smyth Bros., Leiston.

New Houses in Glasgow.

The Minister of Health recently visited the two new types of houses at Dalmuir and Burnside which have been built with a view of helping on the solution of the housing problem. In the morning Mr. Wheatley visited the Beardmore works at Dalmuir, where a new type of steel house has been constructed. The other house, which has been erected by Messrs. John M'Donald, contractors, Burnside, on a site on the East Kilbride road, was inspected in the afternoon. The usual materials have been utilised in the building of this house, which has three apartments and a scullery and bathroom. Mr. Wheatley stated it was an interesting fact that people in the industry had awakened to the possibility of competition from other directions, and were turning their attention to the production of houses of the existing type by mass production methods.

Woodbury County Court House: Main Entrance.

MR. WILLIAM L. STEELE, Architect; MESSRS. PURCELL & ELMSLIE, Associated Architects.

COMPETITION NE

Christian Science Church, Southport

Designs are invited for a new churc Sunday school at the First Church of Scientist, Southport. Premiums of £7 and £30 are offered respectively. The as are Messrs. J. E. Sanders & Son, A.R. 219A, Lord-street, Southport, to whom a tion should be made, accompanied by a pa of 10s., returnable only to those who s designs. (See advertisement this week.

Manchester Art Gallery.

The sending-in day for this competit January 20, 1925. (See our issue for Aug

Concrete Cottages.

Designs for cottages of concrete constr Prizes of 30 guineas and 15 guineas for th designs and, in addition, the successful tect will be paid architect's fees for w drawings and details, but will not be re to superintend erection. Particulars Messrs. G. & T. Earle, Ltd., Wilmington.

The closing date for this competit October 31. Particulars can be seen a Office.

Methodist Church.

Designs are invited for a Methodist C school house and manse, Sheffield. Parti from Mr. T. A. Hardy, 24, Thornsett Sheffield. (See our issue for September 5

Barrow Hill Memorial Club.

Applications are invited for plans specifications for the erection of a clu way of extension of the existing Barro Memorial Club, near Chesterfield. Approx cost, £4,000. Particulars can be obtained the Secretary of the Club. (See advertis this week.)

Other Competitions.

Other competitions still open includ following (the dates given are, first the send date, and second the issue of *The Buil* which full particulars were given):—Ross- Memorial (Sept. 30; Feb. 22). Public Newton-in-Makerfield (Sept. 30; July Harrogate Infirmary (Sept. 30; Aug Masonic Hall (May 1). Glasgow High (Sept. 30).

BRONZE DOORS, BANK BOSTON, BUENOS AI

THE solid cast bronze entrance door illu on p. 467, is the largest metal door, we t that has ever been produced in this c The dimensions are 20 ft. in height by wide. The door is in solid cast bron weighs 3½ tons. The decorated pane borders are finely chased and form a s example of metal craftsmanship. The were cast in the foundries of the Birm Guild, Ltd., Grosvenor Works, Gro street West, Birmingham, to the desi instructions of Messrs. Yorke & Sawyer tects, of New York, in conjunction with Chambers & Thomas, of Buenos Aires, consulting engineers in connection wi work were Messrs. Stone & Webster, of U.S.A. The doors are for the main entr the Bank of Boston, Buenos Aires, America. They are to be fitted with gearing for raising and lowering. It is i ing to note that the production of this metalwork was entrusted by American tects to a Birmingham firm.

Architects' Estates.

Mr. Joseph Nodal, of Heaton Gables, Mersey, near Manchester, architect and e £11,375.

Mr. John Exton, of Marsh-street, Man road, Bradford, architect (net pen £2,827), £4,566.

THE VIRTUE OF THE ANONYMOUS

By DUDLEY HARBRON.

PUBLICITY in the interest of architecture as an art or calling is excusable. In the interest of individuals it is selfish. At times it may be tolerated for the smile that its devotees may bring on occasion to the most pessimistic. We can afford, not being competitors, to laugh when we read how Philibert de l'Orme, the builder of the Tuileries, and a very pushing young man, was pleased to measure the Triumphal Arch of S. Maria Novella just when several Cardinals and nobles—possible clients—happened to be passing. But we jeer when his modern imitator rings the bell in the close and asks a Minor Canon to hold his tape when he measures the Cathedral. Such actions are not quite fair. Fortunately, they defeat their own aim. It is policy to wait for the Minor Canon to volunteer to assist, rather than to aggravate him by repeating a custom which has worn thin.

Advertisement always tends to overreach itself. So doing, it appears to the onlooker who is impartial as ridiculous. The memorial to the late Prince Consort, in Hyde Park, is an instance. Admired by the Victorians, with some few exceptions (John T. Emmett amongst them), now so anathematised by the Georgians, it has, as has been noticed by E. V. Lucas in one of his delightful papers on Saturday afternoon, unconsciously overstepped the mark; for, as he indicates, "Indeed, such is the emphasis that Giotto and Michael Angelo each comes into the scheme twice—once as a painter and again for structural design."

You can call "Wolf" once too often. I am not sorry I do not figure on the podium, garbed in a frock coat, as do several eminent gentlemen.

The code of "Professional Conduct and Practice" permits—nay, encourages—the artist to sign his work. This has led the architect in some cases to have his initials cast upon the rain-water heads. No assayist has yet condescended to rescue his partial evasion from the deserved oblivion of the back elevation. Doubtless the owner feels a little tired when, for the twentieth time, he is asked by his guest to explain the enigma. Work that is worth initials is hardly in need of such adventitious aid; it speaks for itself. Its creator is evident in its lines and nuances, its colour and proportions.

At one time there was a virtue in anonymity that perhaps, if we are not too optimistic, is now a little outworn. The work was not worth signing. Observers have said so. I do not press the point. I leave the words of Pater as I find them in his essay in the *Guardian*: "Our generation, quite reasonably, is not very proud of its architectural creations—confesses that it knows too much—knows, but cannot do."

We, not quite so bashful, murmur, "Thank heaven we have outgrown such observations, and are not ashamed to own our creations." But, is it wise? Is it necessary? It has been indicated for a very good reason that it is not the latter. The wisdom of it may be left for others to determine. Who wants to know? Where ignorance is bliss, 'tis folly to enlighten. There are advantages in residing in the country away from the telephone. Even being in *Who's Who* has its inconveniences.

That which to-day we look upon with pride, may to-morrow turn and rend us—may even be designated a terra-cotta monstrosity by our fellows, a shocking waste of material; one can never be sure of the judgment of even the immediate future. If our critics cannot without effort find our names—and they are habitually lazy—we can sleep the more comfortably in our beds; perhaps mercifully forget our youthful indiscretions. If we have signed, then all that remains to do is to sneak out at night with a chisel and mercifully erase our signatures. As we cannot use pseudonyms, if we must sign let it be out of sight. On the top of the cornice the plumber may chance upon it and forgive. On the top of the door, where nobody ever dusts, and the painter seldom paints.

The Greeks sensed the matter rightly when they gave pseudonyms to their gods to preserve their dignity. Our dignity must be conserved at all cost. The politician, tired of publicity, seeks the anonymous in the House of Lords. Too few architects get there. If the worldly-wise thus decide, why should we, traditionally, happily, as Belloc says in "Unknown People," "the most anonymous of all the arts," seek a place in the limelight that our complexion will not stand? Is it not better, continuing the simile of the stage, that we should, like the actor, conceal our identity behind our rôle, until called by a clamant public to make our bow before the curtain? Of course, some of us may organise clacks—some of us have—but the gallery know the source of the applause. I will say nothing about the excitation of envy if half the street is to be plastered with somebody else's name. Nor yet of covetousness—that the client should be so fortunate. No, we must contain ourselves. Display the owners' arms, if need be, not too often. Be ourselves content with a humble monogram, mayhap on the head that takes the bathroom waste; for after all it is not our own, but another man's house, a matter that the advertiser is apt to overlook.

We can admire the solution of the problem by our compeers who have succeeded, without signatures. They infallibly stamp other people's houses as their own. Into such a category has passed the mansion of many a noble lord, now only recognised as "that house of Norman Shaw's." In the same manner we speak of "Inigo Jones's Banqueting Hall": filching from a King his rightful claim.

That is the sort of advertisement worth striving for. Until then, let us be modestly anonymous.

CORRESPONDENCE

Architects' Benevolent Society's Insurance Scheme.

SIR,—May I trespass on your columns for a little space in which to call the attention of your readers to a very simple way in which they can help the Architects' Benevolent Society?

If in the next insurance they effect—be it on their life, their house, its contents, or any other thing that is theirs—they will ask their insurance company to put it through the agency of the Architects' Benevolent Society, the commission will be given to the Society as a subscription in their name.

Architects are not usually agents for insurance companies, and therefore these agency commissions, which in the aggregate must amount to a very large sum per annum, are dissipated as far as the profession is concerned. The aim of the Benevolent Society is to collect them and expend them for the good of the profession.

This is one of those simple proposals which, like "Daylight Saving," is so obvious that one wonders why no one thought of it before. The medical profession thought of this one some years ago, and are now, I understand, making a large income for medical charities out of it.

We architects can now do the same without even trouble for ourselves, and with great benefit to our Benevolent Society.

MAURICE E. WEBB,
Chairman,
A.B.S. Insurance Sub-Committee.

Friction in the Building Trade.

SIR,—May I, as a layman and a foreman, be permitted a little space in order to comment upon the letter in last week's issue, by a past-President of the L.M.B.A., bearing upon the question of the 46½ hours a week? My remarks bear upon the London area only.

It seems to me that the solving of the 46½ hours a week perplexity has been very dilatory; that it is now too late, and certainly serving no useful purpose in bringing it to the fore. The real point at issue should be how to get the best results. Of what use is it when we know that no matter how many hours are worked quite 50 per cent. cannot pul weight. I think over this matter the em have used the wrong tactics. They hav trying to get the 44 "objective" ball i "46½" pocket by striking it full on. are two ways to deal with these things markian or psychological; either to k striking hard and trusting to the luck run into the pocket, or, after you have yourself why it can't be done, you rea going a little to the off the thing is done. I submit that the question of the 46½ from the employees' point of view has no fully understood. The question of the hours does not enter into the argum the average employee; in fact, from have experienced there is no difficu getting men where overtime can be w This is well known to the trade union o The reason for their sticking to the 44 is that they think, rightly or wrongly, they work longer hours—in a general s sooner or later there will be a revision position and that the sum total per wee be brought into line with the cost of basis, with a consequent reduction per This is preached and emphasised in every union branch, shop and job. The overc of this difficulty will solve the problem

I think, too, that it must be remem that the majority of trade unionists are st for their rules; some through the fear of found out, I admit; and I do suggest there was a diversity of opinion ex between the employer and employee ov interpretation of the Fraser Award. A decision was the only way out.

It would not have been very difficult test case, for some possibly antiquated point to have been brought to light, and a action for not complying with the A brought against certain men or unions su say, the A.S.W., who had it printed in their monthly journals that the 44 was to be worked. The decision of the A Award would have received its legal and p interpretation, no harm would have been and it would have been very interesting re

There is just another point upon the m I don't think it is fully understood the am of time that is spent in travelling to and work. Most men live in the suburbs; two or three hours daily are spent in trav many of them having to strap-hang. T getting a serious matter, for whereas pre-war worker used to make it a coming up West, he now finds that h do better in and around his own locality. result is that we are getting a younger, perienced, post-war type of worker, wit glamour of London, and with the know that no matter how "duffy" he is, h "bunch in" somewhere. This is the that flieth by day to the foreman who h to get a "move on." In fact, there is than one righteous foreman who has mor once dangled over Hades, or been driv Colney Hatch through the incredible "bloo that have been made by these men. A everything done, little or great, must r personal supervision. The sketch of Pink's" workmen cutting the wrong supply or fixing nails for coat hangers is not

It is easier for a camel, &c.; noth mentioned about foremen. *Verb sap.*

Personally, I have come to the conc that there is no real incentive for a man his best (I speak of the casual employee not those who become attached to dir firms), and that the only solution to problems is a system or method of g which could be approved by both sides.

Next year the 46½ hours will be in oper but the aforementioned woes of foreme not cease; therefore I do suggest tha matter of grading, together with security, receive careful consideration, and that sides be given space in your journal to the pro's and con's, and that in conclusi all think less of what might have bee more of the goodwill and prosperity building industry.

THE ARCHITECT'S DEBT TO RUSKIN

By HALSEY RICARDO, F.R.I.B.A.

On March 31 an able and lively paper was read by Mr. H. S. Goodhart-Rendel on "English Gothic Architecture of the Nineteenth Century" at the Royal Institute of British Architects. The lecturer dwelt only slightly—as hardly within his scope—on the moral awakening as regards the workman's part in the evolution of mediæval architecture that took place during the latter half of the century. He recognised the intense conviction of men like Pugin, Butterfield and Street that the "Gothic" forms of the past represented a fervour of English (and North European) feeling that still lingered, and could be encouraged to burgeon forth again, and that it was their mission to foster a gospel that was stirring in the minds of the earnest thinkers of the time. Those architects came in on the crest of the full tide of religious emotion at that time flooding the land, and the enduring value of their work was the mass of cultivated opinion that supported and urged them on to provide the ideals of "Christian" architecture. It was a wonderful, wide-spreading, passionate backing, and its power pervades and strengthens the conceptions of the great architects of that time. None of the three that I have named (nor many of their architect contemporaries) ever for a moment doubted but what the "Gothic style" could prevail over all others in the future—in England at least, if not throughout the Christian world.

But it was the æsthetic side of the movement that made the first appeal, and it was not till the publication in 1849 of Ruskin's "Seven Lamps of Architecture," and in 1852 of the second volume of the "Stones of Venice"—in the famous chapter on "The Nature of Gothic"—that a real appreciative analysis of Gothic art was given to the world. How it fell on the ears of the laity lies outside the scope of this article. The architectural world was far from being prepared to receive it. *The Builder** (the mouthpiece of the profession) prophesies that "his doctrines will fall to the ground and be, if not forgotten, remembered and referred to only as the visionary speculations of one who shows himself determined to be original *coûte que coûte*. . . . And surely there must be something very peculiar in that gentleman's idiosyncrasy when we find him so dotingly enamoured of the ducal palace and St. Mark's at Venice, in which he is pleased to behold supreme *loveliness*, the very last quality which anyone else would ever think of attributing to that grotesque pile."

And again, after the publication of Vol. II of the "Stones":† ". . . if passion and prejudice, or something else that is inexplicable, did not lead their author into gross and pernicious extravagances and errors; errors and extravagances the more dangerous for being advocated with unusual literary powers and sometimes a witching eloquence." In the *Civil Engineer and Architect's Journal* for July, 1849, we find: "Mr. Ruskin lays by far too much stress upon the value of material as absolutely essential to excellence of design. Even when there is equal beauty of both material and design, it is for the latter alone that the architect himself can claim any merit, for as to the other, and the workmanship of it, they belong not to him, but in the first instance to his employers, and in the next to the actual operatives. As far as his own talent is concerned, it makes no difference whether his ideas be realised in genuine of fictitious materials."

We have travelled a long way from this attitude during the past seventy years, and we owe to Ruskin's insight and compelling eloquence the guidance that has befriended us. He was the first to insist on the humanity of art—that works of art had moral and intellectual qualities as well as æsthetic—that they expressed and summed up all those qualities and the social conditions in which they were produced. So, to quote Clutton Brock,‡ "his criticism gave a new importance to works of art, as being the clearest expression of men's minds which they can leave to future ages; and in particular it gave a new importance to architecture and all the applied arts, since, being produced by co-operation and for purposes of use, they express the general state of mind better than those arts, such as painting, which are altogether the work of individual artists. All this Ruskin saw; and he saw that the building and applied art of his own time were bad as they had never been before. And this badness troubled him as if it were something corrupt and sinister in the manners of men and women about him. It was not merely that he missed a pleasure which other ages enjoyed; he also was aware of a positive evil from which they had been free. Art for him was not a mere superfluity that men could have or not as they chose; it was a quality of all things made by men, which must be good or bad, and which expressed some goodness or badness in them. So, from being a critic of art, he became a critic of society, and, after writing about old buildings and modern painters, he wrote about political economy, about the order and disorder of that society which produced all the ugliness of his own time."

The "Lamps" were published in 1849; the "Stones of Venice" in 1851-2-3. William Morris went to Oxford in 1853; and the chapter on "The Nature of Gothic" sank deep into his nature, and all his ideas about art grew out of it.

There had already been plenty of tabulation and classification of the outward aspects of British mediæval buildings: antiquarians and architects, such as the elder Pugin and Rickman, had measured, drawn and grouped into "periods" selected specimens, but they all only dealt with the aspects of the buildings. It was Ruskin who penetrated past the veil of appearances and reached to the maker of the things made. The burden of the cry in the "Stones"§ is that men had lost a joy in life, a loss of which they were only dimly, if at all, conscious: with him the discontent became conscious, was analysed and analysed on scientific grounds. "Let me not be thought to speak wildly or extravagantly. It is verily this degradation of the operative into a machine which, more than any other evil of the times, is leading the mass of the nations everywhere into vain, incoherent, destructive struggling for a freedom of which they cannot explain the nature to themselves. Their universal outcry against wealth, and against nobility, is not forced from them either by the pressure of famine, or the sting of mortified pride. These do much, and have done much in all ages; but the foundations of society were never yet shaken as they are at this day. It is not that men are ill-fed, but that they have no pleasure in the work by which they make their bread, and therefore look to wealth as the only means of pleasure. It is not that men are pained by the scorn of the upper classes, but they cannot endure their own; for they feel that the kind of labour to which they are condemned is verily a degrading one, and makes them less than men. Never had the upper classes so much sympathy with the lower, or charity for them, as they have at this day; and yet never were they so much hated by them: for, of old, the separation between the noble and the poor was merely a wall built by law; now it is a veritable difference in level of standing, a precipice between upper and lower grounds in the field of humanity, and there is a pestilential air at the bottom of it. I know not if a day is come when the nature of right freedom be understood, and when men will se to obey another man, to labour for him reverence to him or to his place, is not s It is often the best kind of liberty— from care. . . . To yield reverence to a to hold ourselves and our lives at his di is not slavery; often, it is the nobles in which a man can live in this world. is, indeed, a reverence which is servil is to say, irrational or selfish: but t also a noble reverence, that is to say, able and loving; and a man is never s as when he is reverent in this kind even if the feeling pass the bounds o reason, so that it be loving, a man is by it. . . . And therefore, in all ages countries, reverence has been paid and fice made by men to each other, no without complaint, but rejoicingly; and f and peril, and sword, and all evil, a shame, have been borne willingly causes of masters and kings; for all gifts of the heart ennobled the men wh not less than the men who received the nature prompted, and God rewarded the fice. But to feel their souls withering them, unthanked, to find their whole sunk into an unrecognised abyss, counted off into a heap of mechanism, bered with its wheels, and weighed w hammer strokes—this nature bade no God blesses not—this humanity for n time is able to endure."

He was the first to recognise and voi discontent—this new danger to the life —and his eloquent exposition of the first principles of social economics struck a re from the inarticulate fretted chords breasts of thinking men. Carlyle had over this ground, like a prairie fire, sco and withering the rampant vegetation t itself upon the discontented field—ba lyle's indignant scolding, fierce for destr was little helpful to the oppressed cr under the harrow. Ruskin, as pr brought a gospel that opened out a v relief—a gospel that has changed men's on humanity. As preacher he spoke conviction that mastered his audienc burning sincerity was beyond all questi above all dispute. As teacher he spok authority. His knowledge of art cou be questioned—he spoke from an exp granted to few men—possibly to no man—he had stored and analysed an in accumulation of facts and examples, a theorist, but as a delineator with the powers of perception and representation. he said about the masterpieces of archi could not be brushed aside as the *obite* of an amateur: you might disagree as conclusions, but they could not be ign

His teaching underlies and transfus present practice of architecture, althou external garniture does not necessarily Gothic forms—indeed, to state a p under the present conditions of buildi our social requirements, the use of forms would, in most cases, imply a of the Gothic spirit. The attention t conditions, local characteristics, local m (where the circumstances permit) in th tecture of to-day testifies to the exist this spirit; the encouragement to ind handling and individual treatment material by the craftsman employed is nificant feature: the mason is required his experience of the nature of the st has to deal with, their choice and thei ment; the bricklayer is directed helpf the matter of bricks, as to their sou their texture, and the beds of mortar or they are laid; the carpenters and join preciate the demand for cordial co-op in the job, and the insistence of a high st of execution; the common phrase of made" this and "hand-made" that, the recognition and the demand f human touch, slight as in most c must be.

Even in the case of machine-made

* *Builder*, May 10, 1851, Vol. IX, No. 431.

§ "Stones of Venice," Vol. II, Chapter vi. Nature of Gothic, page 163 *et seq.*

abour has begun to discover that there can joy in work, that men and women need not main slaves of the machine; to discover that e workman can reassert his supremacy over s own handiwork, and once again make the achine his servant. It was inevitable, too, nen this time should arrive, that the folly olitical and commercial) of any other system ould be made plain. This folly is revealed d exposed in the 1922 report of the Indus- al Fatigue Research Board.* In it the thods of the last generation, so far, at any e, as the "human machine" is concerned, e arraigned as virtual robbers of industry, d we are introduced to what is truly a new dustrialism and a new craftsmanship. Ex- iments have been carried out to see if the ed of the machine may not be brought into rmony with the human speed. They have ealed the fact that much can be achieved this way, for in several instances a change pace of the mechanism, either up or down, resulted in an increase of output. The port deals very fully with the selection of prentices by means of tests designed to dis- er their aptitude for the work, and shows v studies of the qualities needed in many ferent industrial pursuits are now being ried out; the selected employees, working teams, represent the new craftsmanship. will no longer pay to subordinate such men the pace of any machine; they are highly lled and they are master of their imple- nts; their output represents their craft— ir pride in their work. If it falls, they fall h it in a way unknown to the victim of e drudgery or mere monotony. The sub- of fatigue is discussed in its bearings on rs of work and on the pace of work, and alterations in arrangements which result nitigating this trouble speedily result in in- ased productiveness. Quite small changes working method have resulted in increases output of as much as 88 per cent. within a months. These changes, too, have fre- ntly converted dissatisfied into cheerful kers, and so, in a general sense, added national efficiency.

is in the regions of applied art—and more cially in the building trades—that the cts of Ruskin's impassioned teaching are t instantly visible; and they are due in t measure to its heartfelt acceptance by most influential architects. This doctrine "the joy of work" and the intimate co- ation of the craftsman found an easier od of realising itself than in other trades, was welcomed and encouraged by all who the true craft of building at heart—and outcome forms the salient characteristic e architecture of to-day. This care for the are of the material and the human con- and labour spent upon it, felt and sub- iated by the architect, makes him cially tender over the treasures bequeathed e nation by his predecessors. Here again oice of Ruskin was the first to proclaim inestimable and irreparable value of relics on our land, and the danger which they stood from the ignorant eciation of the qualities they possessed. appreciation was wholly superficial n Pugin's "True Principles" did go very deep; Professor Willis' "On onstruction of the Vaults of the Middle " (published in 1842), a most able work, only with the problems of their construc- It was a received opinion that all the ng parts of old buildings ravaged by or violence could be replaced with new identical (where the necessary evidence be ascertained) with the vanished por- that the mediæval work should be purged bsequent accretions differing in date and from the (supposed) main conception, he (conjectural) original portions supplied w work equivalent to the lost pieces. these restorations could not be made ilent formed no part of its creed, and struction that ensued, under the head of

Presidential Medallion of the York and East Yorks Architectural Society.

repair, of precious work under his own eyes, stung Ruskin to vehement protest. "The Seven Lamps of Architecture" was published in 1849, and in the sixth chapter ("The Lamp of Memory") there are these two "aphorisms"—No. 27: "There are two duties respecting national architecture whose importance it is impossible to overrate: the first, to render the architecture of the day historical; and the second, to preserve, as the most precious of inheritances, that of past ages"; and No. 31: "Neither by the public, nor by those who have the care of public monuments, is the true meaning of the word *restoration* understood. It means the most total destruction which a building can suffer: a destruction out of which no remnants can be gathered: a destruction accompanied with false description of the thing destroyed. Do not let us deceive ourselves in this important matter: it is *impossible*, as impossible as to raise the dead, to restore anything that has ever been great or beautiful in architecture." Ruskin returned to this vitally important matter in a pamphlet he published in 1854, entitled "The Opening of the Crystal Palace considered in some of its Relations to the Progress of Art," in which he speaks of the restorations which "have actually begun like cancers on every important piece of Gothic architecture in Christendom; the question is only how much can yet be saved." He suggests: "Something might yet be done, if it were but possible thoroughly to awaken and alarm the men whose studies of archæology have enabled them to form an accurate judgment of the importance of the crisis. . . . An association might be formed, thoroughly organised so as to maintain active watchers and agents in every town of importance, who, in the first place, should furnish the Society with a *perfect* account of every monument of interest in its neighbourhood, and then with a yearly or half-yearly report of the state of such monuments, and of the changes proposed to be made upon them; the Society then furnishing funds, either to buy, freehold, such buildings or other works of untransferable art as at any time might be offered for sale, or to assist their proprietors, whether private individuals or public bodies, in the maintenance of such guardianship as was really necessary for their safety; and exerting itself, with all the influence which such an association would rapidly command, to prevent unwise restoration and unnecessary destruction. . . . I make this appeal at the risk of incurring only contempt for my Utopianism. But I should for ever reproach myself if I were prevented from making it by such a risk; and I pray those who may be disposed in any wise to favour it, to remember that it must be answered at once or never." It was in 1877 that the Society for the Protection of Ancient Buildings was founded. The influence of this Society has been of incalculable benefit to architects in giving its support to them against projects, well-intentioned, for restoring objects of beauty and historical interest which the enthusiasts for their preservation are unable to see can only lead to the destruction of their history and interest. So much of Ruskin's teaching has been absorbed by all earnest-minded men, that it has passed from polemic into platitude, and one is apt now to forget the prophet in the fulfilment of his prophecies. His teaching about art may not cover the whole ground; his teaching about political economy may not cover the whole ground; but the truth of his impassioned cry has told on the world—has changed men's outlook on life and art. The local and temporary accidents of his teaching—on which his antagonist contemporaries vociferously fastened on—have dropped away through the lapse of time and that sad unlearning that we call experience; our present-day definition of art, due to his insight, plays its part in the architect's debt to Ruskin.

Royal College of Art.

The Prospectus of the Royal College of Art, South Kensington, has just been issued for the session 1924–5.

The School of Architecture, of which Mr. J. Hubert Worthington is Professor, and Mr. H. J. Harding, Assistant Instructor, provides an auxiliary course for the schools of drawing and painting, design and sculpture. This course deals with the relation of the arts to architectural history and practice; the spaces and forms of buildings that are decorated in colour or enriched with sculpture; the employment of the crafts in furnishing and completion; and the study of geometrical draughtsmanship for technical purposes. Students will enter upon a course in the architecture school, upon the recommendation of the professor of their own school; such a course may be taken as preliminary to or at subsequent periods of their college career.

A special full-time course will be available for students studying with a view to the College Associateship in Architecture. The aim of the course is the study of the art of design in architecture, its objects and means of expression.

Advanced studies will be continued in post-diploma study. Measured surveys of buildings away from the College may be undertaken, the drawings being worked out in the School. Collaboration with painters, sculptors and designers in a complete scheme for a building or for an important design will be arranged under the joint advice of the professors.

Copies of the Prospectus are obtainable at H.M. Stationery Office, price 6d., by post 7d.

York and East Yorkshire Architectural Society.

The pendant illustrated on this page is executed in silver gilt with azure enamelled convex section oval ground, upon which the coats of arms of the important centres within the area of the York and East Yorkshire Architectural Society are depicted; viz., York in the centre, Hull on the left, Beverley on the right, and Scarborough below. The devices are supported by the title of the Society in gold letters on a raised ground, and capped by the White Rose of York. The size of the pendant is 2½ in. by 3½ in., and it was executed by Messrs. Fattorini & Sons, Ltd., Bradford. The Society was founded in 1882, and has a total membership of 69. The President is Mr. Stephen Wilkinson, and the Hon. Secretary is Mr. J. E Reid.

ILLUSTRATIONS.

New Premises, Glasshouse-street.

These premises represent part of the rebuilding of the Quadrant which is now being extensively carried out, and the illustration shows the elevation of the rear portion of the Regent-street premises facing Glasshouse-street. The façade has been designed to harmonise with the design for the Quadrant, and the main lines, such as cornice and stringcourses, have been carried through at the same levels. The whole of the front is being carried out in Portland stone.

The contractors responsible for the carrying out of the work are Messrs. Thomas & Edge, Edwards Construction Co., Ltd., Messrs. Hall, Beddall & Co., Ltd., Messrs. Ford & Walton, Ltd., and amongst the sub-contractors are :— Steelwork, Messrs. W. H. Blake & Co., Ltd., Messrs. Redpath, Brown & Co., Ltd.; stonework, Messrs. F. Mortimer, Ltd., Messrs. The United Stone Firms, Ltd.; patent floors, Messrs. Diespeker & Co., Ltd., Messrs. Bradford & Co.; heating, Messrs. Brightside Foundry Engineering Co., Ltd., Messrs. Mumford, Bailey & Preston, Ltd.; casements, Messrs. Mellowes & Co., Ltd., Messrs. W James & Co., Messrs. Wotton & Sons; lifts, Messrs. Express Lift Co., Ltd., Messrs. Marryat & Scott, Ltd.; electric lights, Messrs. Macfarlane, Messrs. Marryat & Place, Messrs. Cecil Cooper & Co., Ltd.; fire escapes, Messrs. The Lion Foundry, Ltd., Messrs. Haywards, Ltd.; wrought iron balconies, Messrs. Caston & Co., Ltd.; artificial stone, Messrs. Stuarts Granolithic Co., Messrs. Bradford & Co.; pavement lights, Messrs. King & Co., Messrs. Geo. Wright, Ltd.; asphalte, Messrs. Limmer and Trinidad Lake Co., Ltd., Messrs. Ragusa Asphalte Co., Ltd.; terrazzo paving and tiling, Messrs. Diespeker & Co., Ltd.; wood block flooring, Messrs. The Acme Flooring and Paving Co.; plaster decoration, Mr. Paul Turpin; ironmongery, Messrs. Chas. Smith, Sons & Co.; cast leadwork, Mr. J. L. Emms; carving, Messrs. Gilbert Seale & Co.; modelling, Messrs. W. Aumonier & Son; W.I. stair balustrades, Messrs. Starkie Gardner, Ltd.; shop front, Messrs. Saml. Haskins & Bros., Ltd.; lantern lights, Messrs. W. James & Co.

The architects for whole façade and reconstruction of Messrs. Du Deney, Brown & Weir's premises are Messrs. Yates, Cook & Darbyshire. The architect for the reconstruction of the Aquascutum premises is Mr. Gordon Jeeves.

New Nurses' Home, Reading.

This building is being erected in Craven-road, Reading, immediately adjoining the Royal Berkshire Hospital buildings. The Home is designed to accommodate the whole of the nursing staff, about 90 in number, but is so planned that by future extensions the total may be raised to 120.

The building is simply treated, having hand-made red brick facings with Bath stone centre gable and main cornice.

Mr. C. H. Lanfear is acting as clerk of works, and the general contractors are Messrs. W. T. Nicholls, Ltd., of Gloucester.

The following sub-contractors are engaged :— Messrs. Mosdell & Lovell, Mortimer, Berks, hand-made facings; Messrs. S. & E. Collier, Reading, sand lime bricks; Messrs. Bath Stone Firms, Ltd., Hartham Park stone; The Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., all floors throughout; Messrs. Burkenite, Ltd., jointless flooring; Messrs. Stevens & Adams, wood block flooring; Messrs. Cash & Co., Ltd., Westminster, heating and hot-water installations; Messrs. Waygood-Otis, Ltd., passenger lift; Messrs. Jennings, Ltd., Lambeth, sanitary fittings; Gloucester Concrete Construction Co., Ltd., stone staircases, steps and copings; Messrs. Haywards, Ltd., fire escape staircases; Messrs. A. Brown & Co., Birmingham, locks and ironmongery.

The architects are Messrs. Chas. Smith & Son (Harry Hutt, F.R.I.B.A.), of Reading.

Midland Bank, Piccadilly.

We illustrate this week new premises of the Midland Bank just completed on the Piccadilly site formerly occupied by the Old Vestry Hall. Mr. T. B. Whinney, F.R.I.B.A., is the architect to the Bank; the elevations are by Sir Edwin Lutyens, R.A. Elevational drawings were given in *The Builder* for January 5, 1923.

Quarters for Married Military Officers in India.

These designs have been sanctioned by the Government of India for the construction of quarters for married military officers throughout India. The quarters are divided into two classes, for senior and junior officers respectively. Each class is sub-divided into plans for quarters at very hot plain stations, normal plain stations, semi-hill stations and hill stations.

The designs have been worked out with a view to providing the maximum accommodation for the minimum rent. The maximum rent recoverable from an officer is 10 per cent. of his pay, therefore should the assessed rent be over this amount the difference is a loss to Government.

An average cost of the quarters is as follows :—

	Senior Married Officer for Normal Plains Stations.	Junior Married Officer for Normal Plains Stations
Main building ..	Rs. 27,320 ..	Rs. 21,576
Porch	„ 1,250 ..	„ 1,250
Kitchen block ..	„ 4,346 ..	„ 2,997
Servants' houses ..	„ 6,879 ..	„ 5,362
Stables and coach-house	„ 1,993 ..	„ 1,993
Compound wall and gate	„ 1,800 ..	„ 1,800
Total	Rs. 43,566 ..	Rs. 34,378
Total in pounds Sterling	£2,904 ..	£2,291

In accordance with Indian custom the principal bedrooms have a dressing-room and two bath-rooms attached. The dressing-rooms being large enough to be used as an additional two bath-rooms attached, the dressing-rooms being large enough to be used as additional bedrooms when required. The details of the kitchen block have been carefully considered with a view to satisfactory working with Indian servants.

In order to reduce the amount of furniture required to a minimum, each bedroom has bo hanging and shelf cupboards built into the wa The bathrooms are fitted with built-in ang washstands, shelves, and towel racks as fixture

The plans were prepared by Mr. Matthews, F.R.I.B.A., consulting architec for Military Works in India, and approved b Major-General Sir Edwin Atkinson, K.B.E C.B., C.M.G., C.I.E., Engineer-in-Chie Army Headquarters, India.

Woodbury County Court House.

The foundation stone of the Woodbur County Court House, at Sioux City, Iowa, w laid on July 10, 1916, and it was completed an occupied on March 1, 1918. The building of brick with granite base and copings, an modelled polychrome terra-cotta enrichment The entrance is the focal point, with the larg mosaic figure representing the law. Th general colour tone is a rich light brow varied by the colour of the granite base an coping and the unglazed burnt-clay colour the terra-cotta. The windows are of met enamelled a vivid blue, with the sashes picke out in a delicate grey. The sashes throughou are of the casement type with leaded glass.

The *Western Architect*, from which our illu trations are taken, says in reference to th plan of the building :—" In preparing for th study of the court house a careful survey the available data was made. The Board Supervisors were shown that the typical cou house, which is fast becoming 'standardised in the hands of so-called specialists, is a del sion and a snare. They were convinced th the economical procedure would be to develo a plan suited as nearly as possible to th county's needs, and let the exterior appea ance grow out of the plan. Visits were ma to other court houses and sketches were pr pared showing the application of the so-call Classic design to the terms of Woodbu County's problem. The result was that wh the preliminary sketches were finally approv the supervisors were enthusiastic over t evidence that the Woodbury County Cou House would have more actual square feet working space for the money than any cou house previously built. Upon this very pra tical working basis the design was develope and most interesting and fascinating was t working out thereof. The main functio were housed in the lower part of the buildi and the entire available area was used. T offices most frequently sought by the gene public are those of the auditor, treasur recorder and clerk. These four offices a placed on the main floor, and are inter-co municating as well as being grouped about commodious lobby or rotunda."

The floors of the rotunda are a rich b quartzite tile, the walls and piers of Rom brick with large plastered spaces containi mural paintings framed and enriched w cream terra-cotta and coloured inlays of gl mosaic. The dome is lighted by clerest windows above the main roof, and through at all times of day comes a flood of rich tinted light. The mural paintings are by M John W. Norton, of Chicago.

The building, which cost 850,000 dollars, fire-resisting. The only woodwork is a li for ornamental purposes, and the desks a chairs. All doors, windows, and filing ca are metal. Floors are of terrazzo, tile, cork linoleum. Marble is used in the rotunda court rooms and sparingly elsewhere.

The architect is Mr. William Steele, as ciated with whom are Messrs. Purcell Elmslie.

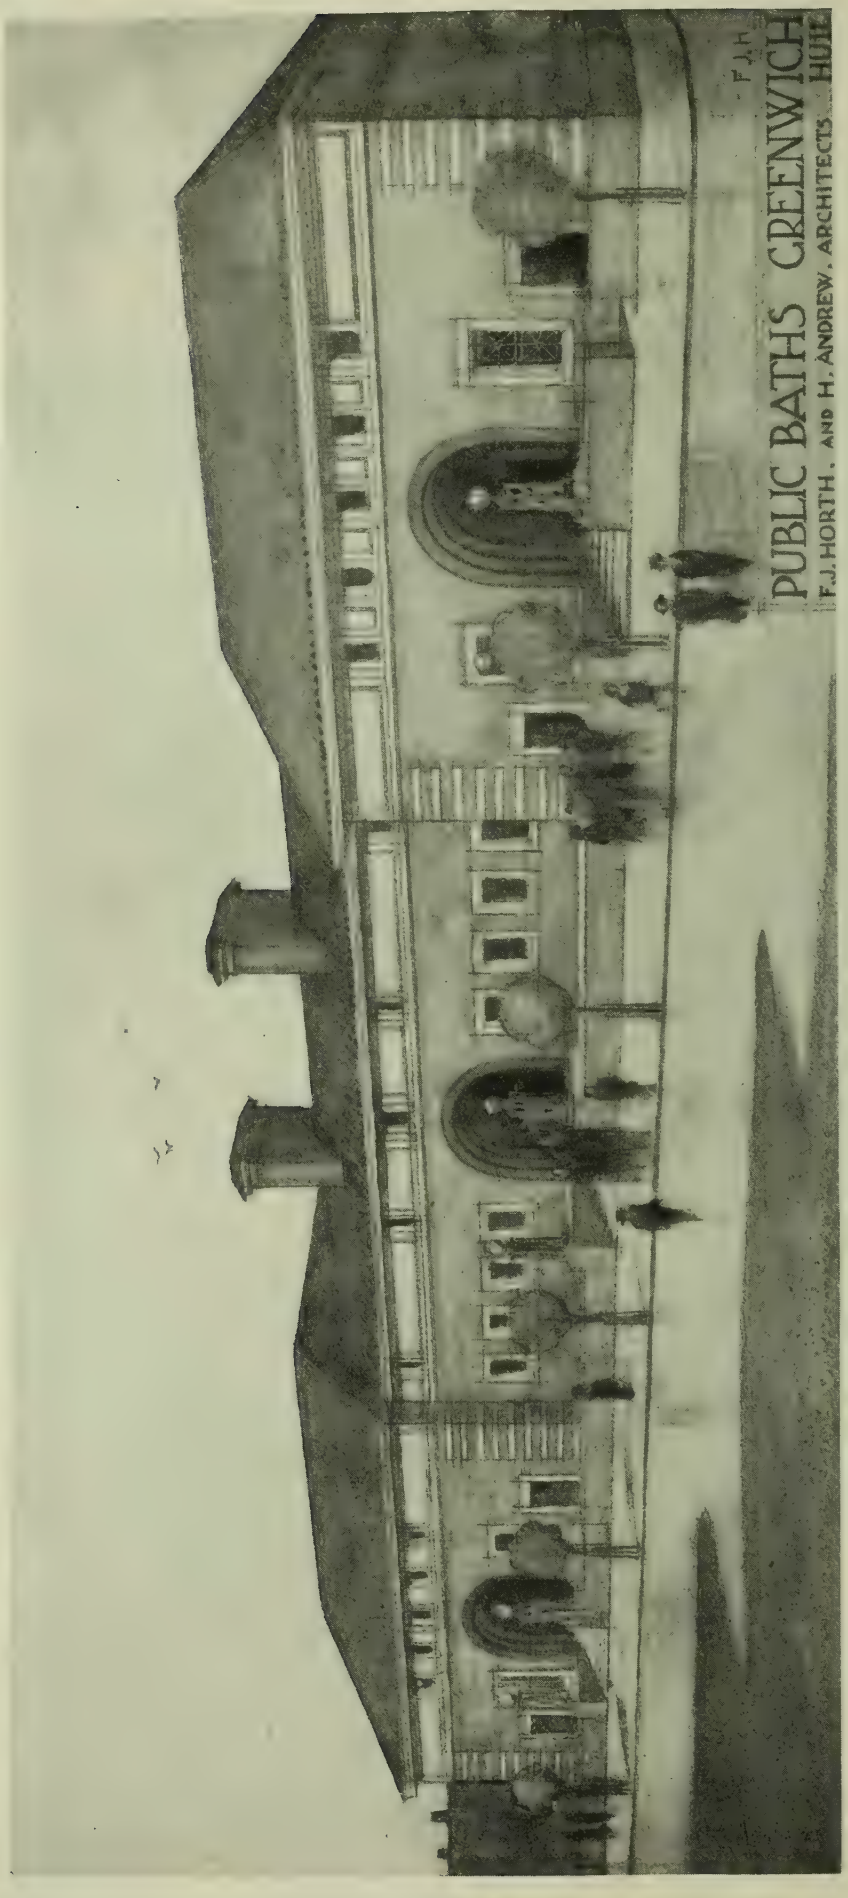
Imperial Delhi.

Mr. R. T. Russell, F.R.I.B.A., is the arc tect of the Gazetted Officers' bungalows the hostel for members of the Legisla Council at Imperial Delhi, illustrated t week. There are verandahs to all rooms protection from excessive light and heat. for the same reason only the bath-rooms h small direct windows.

XMOUTH DEVELOPMENT

IE plans illustrated on this page show the osed "lay-out" of the foreshore at Ex-th, South Devon. Plan "A" shows what t be done by utilising the whole of "The ," but this does not find favour as it roys the natural beauty of the foreshore. lan "B" the sports fields are improved enlarged, and accommodation provided visitors in the way of shelters, combined provision for refreshments and a pavilion. The Marine-drive is continued round the picturesque Orcombe Point, thereby giving easy access to the Cove, at all times and tides, and opening up the higher lands above the Drive and proposed cliff walks.

The design is by Mr. E. Vincent Harris, F.R.I.B.A.

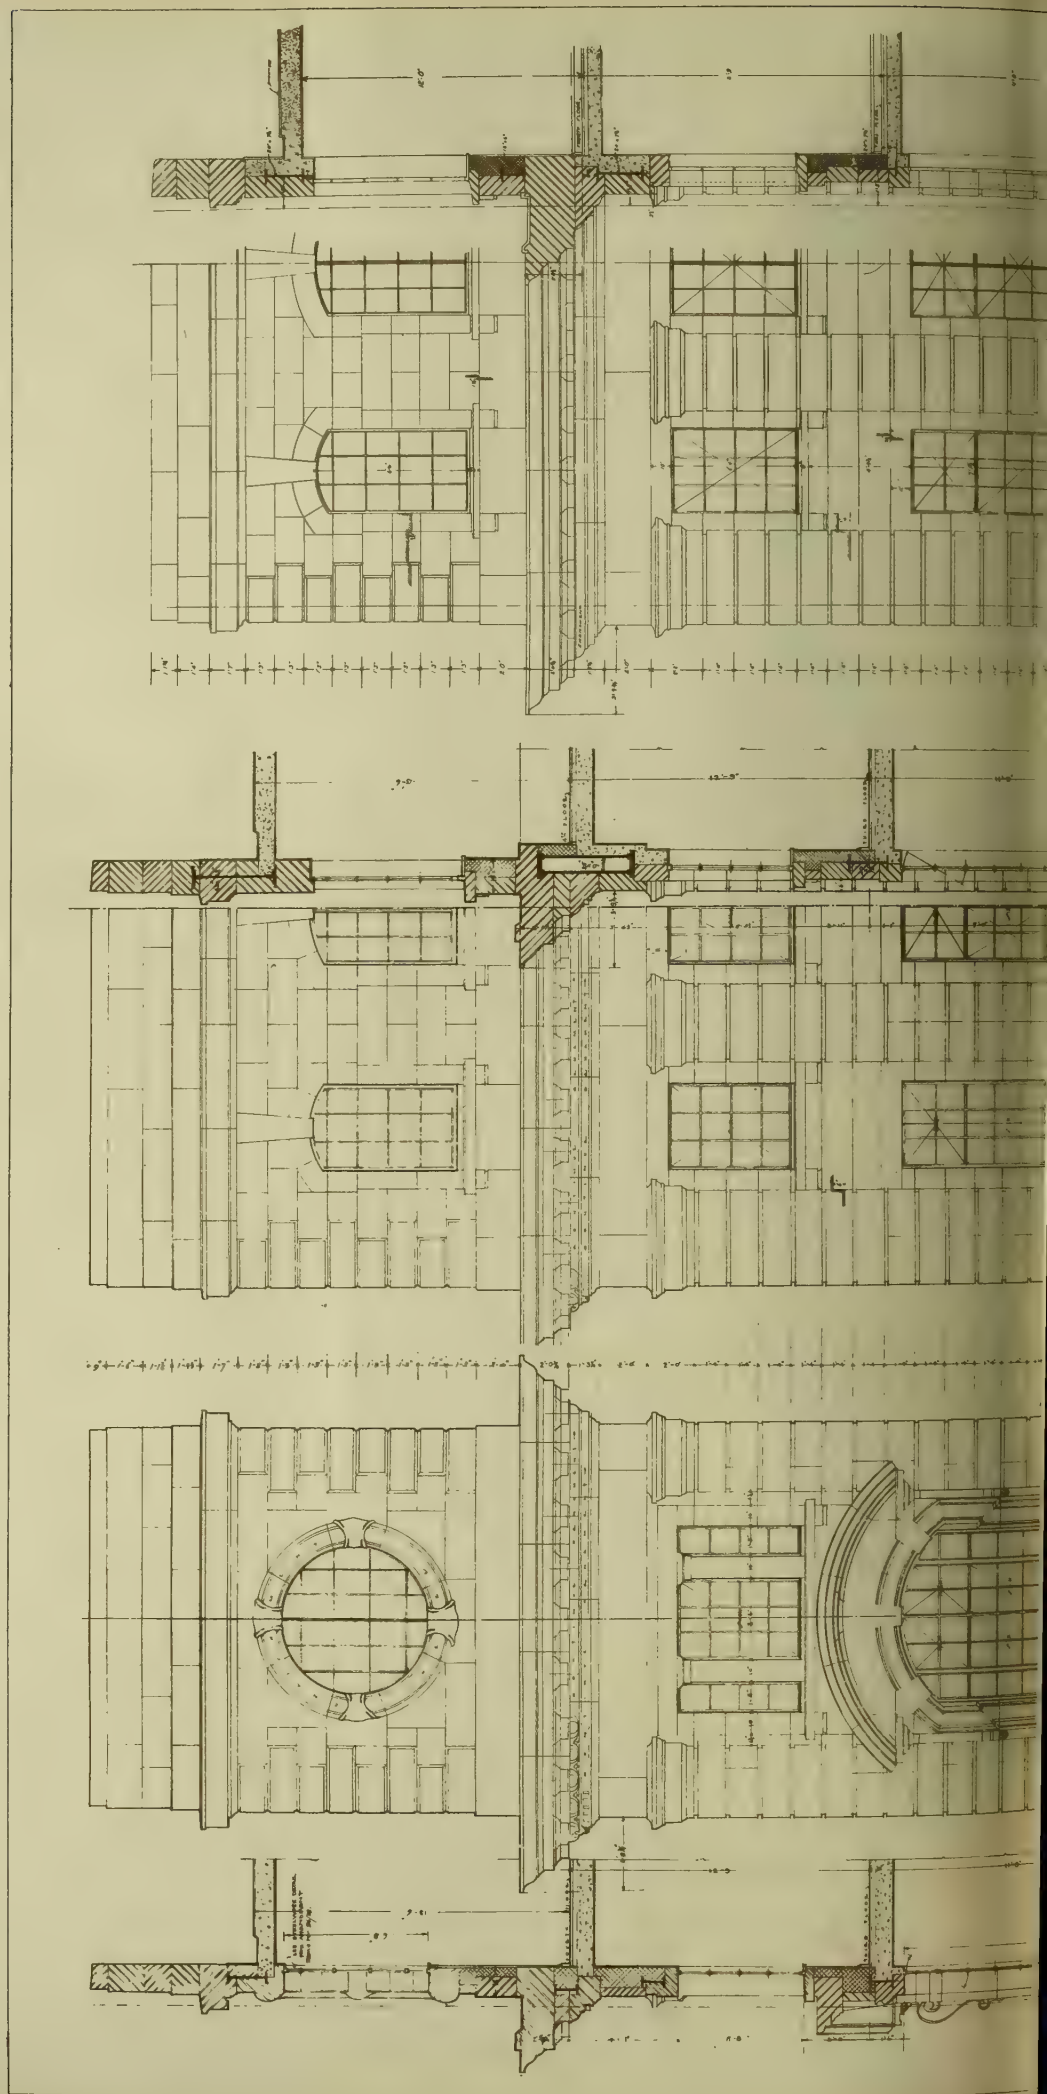


Mediæval Architecture.

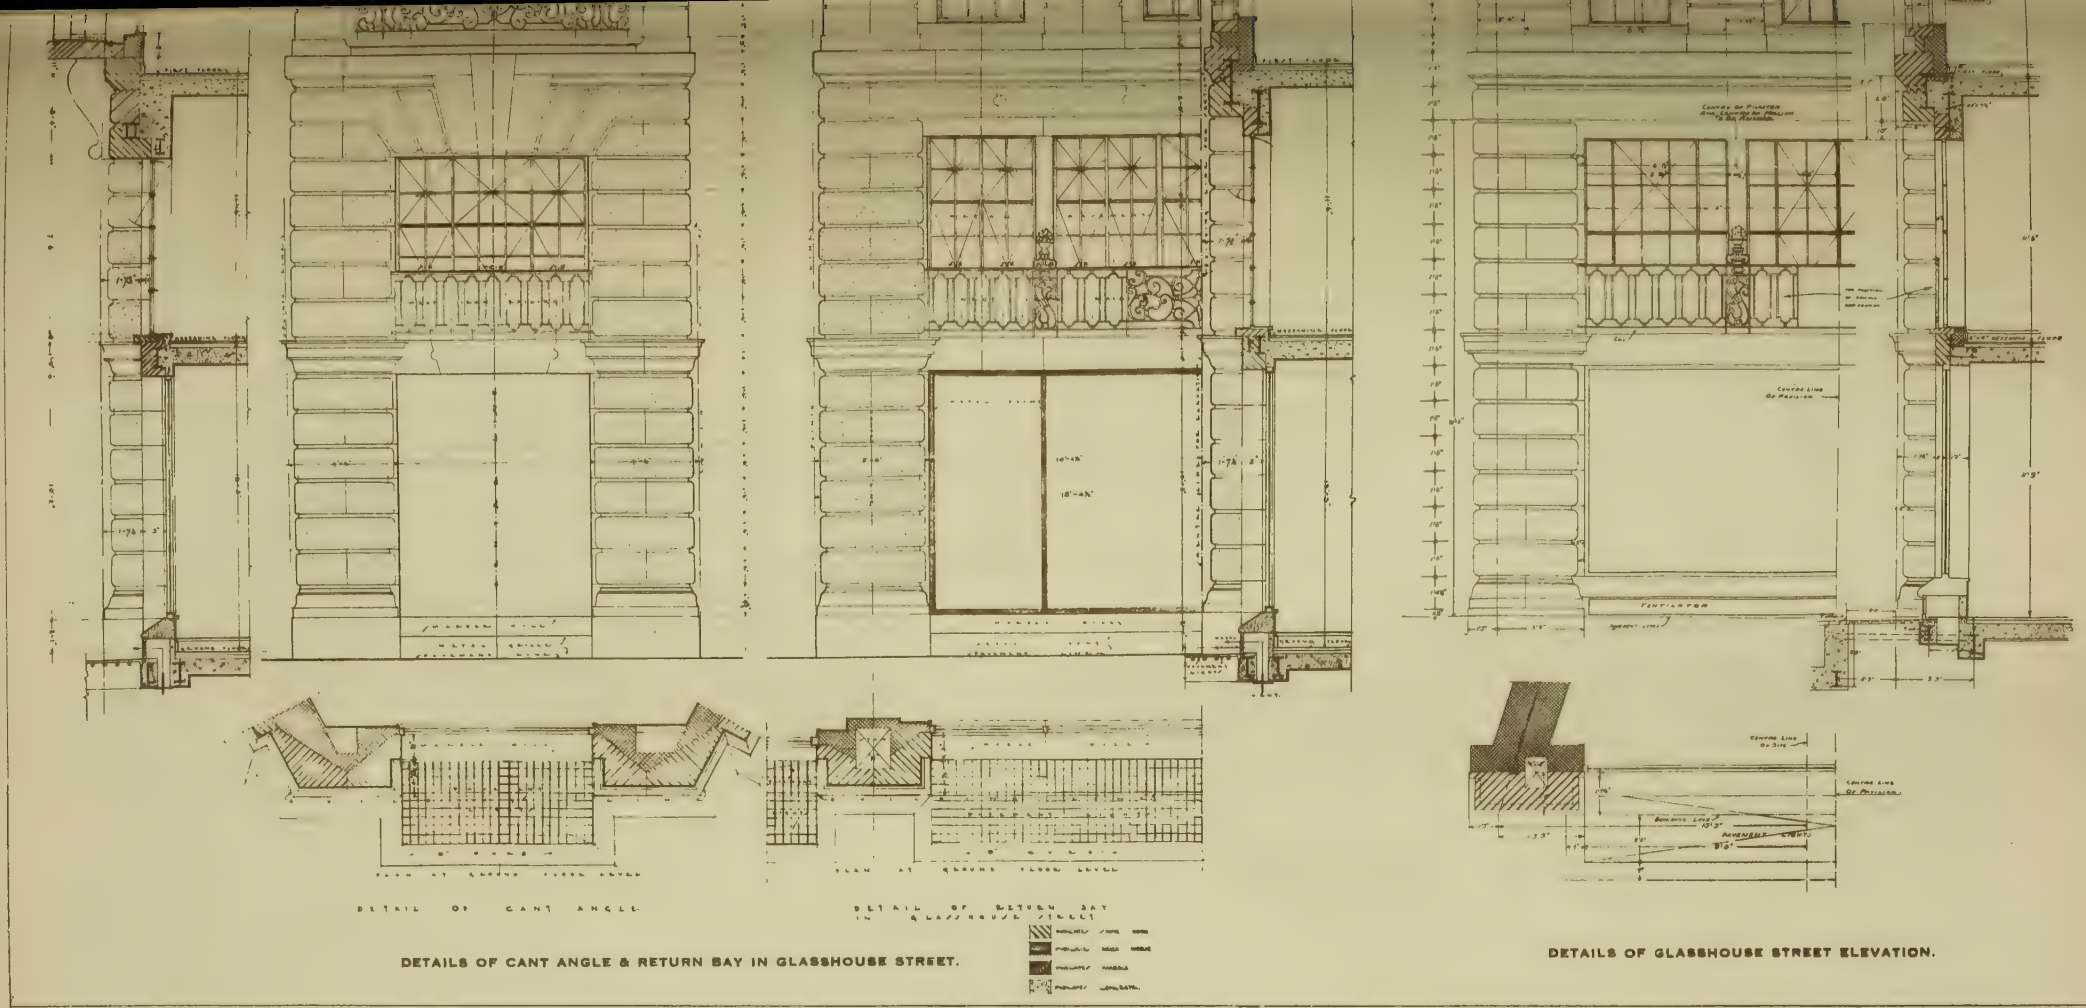
Sir Banister Fletcher, F.R.I.B.A., will continue his series of University Extension Lectures on the History of Architecture at the Central School of Arts and Crafts, Southampton-row, next session, by delivering a course of twenty-four lectures on "Mediæval Architecture." The first lecture, on Wednesday, October 1, at 6 p.m., is open to the public without fee.

Sir Banister will deal with the mediæval architecture of all European countries, devoting the major portion of his time to that of Italy, France and England; each of his lectures will be fully illustrated by means of his collection of specially prepared lantern slides.

Lay-out of Foreshore, Exmouth. By Mr. E. Vincent Harris, F.R.I.B.A.



Accepted Design, Greenwich Baths Competition. By Messrs. F. J. Horth & H. Andrew, AA.R.I.B.A.



[This perspective is a water-colour sketch of the Trafalgar-road frontage, to be faced in 2½ in. multi-coloured bricks, a Portland stone frieze the depth of the first-floor windows, and the roofing in red Roman tiles.]

Quarters for Married Military Officers in India.

MR. B. MATTHEWS, F.R.I.B.A., Architect.

NEW PREMISES, GEORGE-STREET, OXFORD

THIS building is in course of erection for Messrs. Twining Brothers, wholesale and retail grocers. The front elevation is being carried out with Luton bricks of varying colours and Messrs. Lawrence's cherry-red bricks for quoins. The base and dressings are in Clipsham stone. The building is of ferro-concrete framed construction throughout.

The general contractors are Messrs. Wooldridge & Simpson, Oxford. The engineers for the ferro-concrete work are Messrs. The Birmingham Concrete Steel Co., Birmingham.

The steel sashes are being supplied by Mr. J. H. Pye, Moreton-in-Marsh, the electric goods lift by Messrs. R. A. Evans, Ltd., Leicester, the heating by Messrs. Young, Austen & Young, Leicester, the pavement and floor lights by Messrs. Haywards Bros., the rolling shutter by Messrs. Haskins, Ltd., the granolithic stairs by Messrs. Stuarts Granolithic Co., Ltd.

The architect is Mr. Gilbert T. Gardner, Lic.R.I.B.A., 7, St. Aldate's, Oxford.

OBITUARY

The Late H. K. G. Bamber.

By the tragic death of Mr. Henry Kelway Gwyer Bamber, J.P., who was killed in a motor-car accident near Gravesend last week, the cement industry and those interested in the development of concrete as a building material have lost one of their keenest and most popular friends. He was born in 1864, and commenced his business life in the office of his father, the late Henry Kelway Bamber, as an analytical chemist. Later, he took the post of chemist in the Portland cement works of Messrs. J. R. Patrick & Sons, of Harwich, and afterwards entered the service of Messrs. Knight, Bevan & Sturge, probably the oldest firm of cement manufacturers in the world. In this firm he very soon became a junior partner, and the board of the Associated Portland Manufacturers, Ltd., on its formation in Of this concern he acted as one managing directors for twenty-three and he also became a managing of the British Portland Cement Manufa Ltd., on its formation at a later date. these positions he occupied until the last year, when he relinquished the ma directorships, but retained a seat on boards as a consultant, in which capac knowledge and foresight were of very value. He was one of the founders Concrete Institute (now the Institut Structural Engineers); in this body h a great interest and was one of its most committeemen, and was last year elected president. An original member of th Committee of the British Engineering Sta Committee, formed to draft a standard fication for Portland cement, during th two years he had been engaged on nu investigations in connection with the rev the specification now in progress.

New Premises, Oxford. MR. GILBERT T. GARDNER, Lic.R.I.B.A., Architect.

LEGAL SECTION

NOTES ON CURRENT CASES

Restriction: Tenant Furnishing and Sub-letting.

case Prout *v.* Hunter, which we briefly May 30, has been carried to the Court eal and is reported in *The Times*, July 31. ase raised a question of some difficulty the Rent Acts. The plaintiff was the of a block of flats and had let three flats shed to one of the defendants, a Mrs. , who occupied one of the flats herself nished the two others and let them as ed flats to two tenants who appear also been parties to this action. The plaintiff en Mrs. Hunter notice to quit and, from ort at present available, it does not what order was made as regards the flat upied herself, as the appeal was limited case of the furnished flats, the question hether they were under the protection Rent Acts. The point depends upon 12, subsection (2), proviso (i) of the ct, 1920, which provides: "This Act ot save as otherwise expressly provided o a dwelling house *bona-fide* let at a rent ncludes payments in respect of board, nce or use of furniture," and the Divi- Court had held that this proviso applied status of the premises at the particular hat is to say, the letting to the occupying had to be regarded and not the letting original tenant.

e Court of Appeal it was argued that as a difficulty in reconciling this proviso ctions 9 and 10 of the Act which relate to ed lettings, as those sections might be d by the words "save as otherwise ex- provided," but the Court of Appeal out that the Statute operated in two t protected the tenant as to the rent aid, and it protected him from eviction, tions 9 and 10 relate only to rent but bearing on the question of eviction. re the words in the proviso, "save as e expressly provided," apply to the ns as to rent in sections 9 and 10, but bearing on obtaining possession. The us decided that what had to be regarded status of the premises at the material at is, when the claim for possession le, a decision which it pointed out was dance to the case of Glossop *v.* Ashley K.B. 1, THE BUILDER, April 15, 1915). s appears that if a sub-tenant takes from nt of premises let to that tenant un- l, premises or part of premises l by the tenant, those premises or parts ses pass out of the protection of the Act, ppears to us that some questions may to procedure unless, as we understand ase here, the sub-tenants are also joined s when possession is claimed, for other- sub-tenant may rely either upon , subsection (5), which provides: "An judgment against a tenant for the of possession of any dwelling house, ent therefrom under this section, shall t the right of any sub-tenant to whom ises or any part thereof have been law- -let, before proceedings for recovery sion or ejectment were commenced to ssession under this section, or be in perative against any such sub-tenant," ection 15, subsection (3). This section ide note, "conditions of statutory but subsection (3) is in general terms des" Where the interest of a tenant of g house to which this Act applies is d either as the result of an order, or for possession, or ejectment, or for reason, any sub-tenant to whom the or any part thereof have been lawfully all, subject to the provisions of this emed to have become the tenant of the on the same terms as he would have held from the tenant if the tenancy had continued."

The sub-tenant therefore appears, even in the case of a house let furnished, as in this case, to be able to hold the premises and to avail himself of the provisions as to rent contained in sections 9 and 10, but if the landlord desires to get rid of him then he can do so for the premises are not protected as to possession, and section 5 which relates to "Restriction on right to possession" according to the decision in this case does not apply.

It may be remembered that proviso (i) to section 12, subsection (2) and sections 9 and 10 were both amended in the Act of 1923, in section 10, but the amendment does not touch the point decided in this case.

Subsection (1) of section 10 of the Act of 1923 only provides that the proviso excluding the premises from the operation of the Act of 1920 shall only apply where the charges for attendance or the use of furniture, regard being had to the value to the tenant of the same, forms a substantial portion of the whole rent, as otherwise it is not to be deemed a *bona-fide* letting within the proviso. Subsection (2) provides that in section 9 and 10 of the Act of 1920 "the expressions 'landlord' and 'tenant' shall, respectively be substituted for the expressions 'lessor' and 'lessee.'" The reason for this latter amendment appears to be that the former expressions are defined in section 12 of the Act of 1920, whilst the latter are not.

Liability under the Employers' Liability Act, 1880.

Since the principle of Workmen's Compensation was adopted there has been a steady decrease in the cases brought under the Employers' Liability Act, 1880. That Act marked the first stage in extending the liability imposed by common law for accidents to employees, a law which proved defective for many reasons, but perhaps mainly by the doctrine imposed upon it that the workman took the risk of acts done by his fellow workman, that is roughly stated the doctrine of "common employment."

The Employers' Liability Act did away with some of the hardships under the common law, but it was a highly technical Statute involving complicated considerations, and for many years the Law Courts in each year had to consider a number of cases involving these technical points, but in 1897 the introduction of the first Workmen's Compensation Act brought in some degree the principle of insurance from accident into practice, and although the compensation recoverable might be less the workmen preferred to take a sum certain, rather than thread the intricacies of the Employers' Liability Act.

A recent case, James Nimmo & Company, Ltd. *v.* Connell (1924 A.C. 595) has reached the House of Lords on appeal from the First Division of the Scotch Court of Session in connection with the Employers' Liability Act, and it is a reminder of the complication of the Act to find that the House was unable to come to a unanimous decision, but was divided three to two.

Section 1, paragraph (1) of the Employers' Liability Act provides that where personal injury is caused to a workman "by reason of any defect in the condition of the ways, works, machinery or plant connected with, or used in the business of, the employer," the workman shall have the same right of compensation and remedies against the employer as if the workman had not been a workman of, nor in the service of, his employer, nor engaged in his work. In other words his common law rights are extended to the conditions of employment subject to the limit of compensation fixed by section 3.

Section 2, paragraph (1), however, provides that the workman shall not be entitled to any right of compensation or any remedy against the employer under the above paragraph unless the defect therein mentioned arose from, or had not been discovered or remedied owing to the negligence of the employer, or of some person in the employment of the employer, and entrusted by him with the duty of seeing that the ways, works, machinery, or plant were in proper condition.

By subsection 3 the workman is debarred from remedy if he knew of the defect but failed to report it unless he was aware that the defect was already known.

In the case in question the injured workman had been employed as a "brusher" in a mine worked by the appellants. It was a "gassy" mine, that is to say it was a mine where inflammable gas was known to be present. Such mines can be worked subject to the provisions of the Coal Mines Act 1911, which are very comprehensive, but amongst those provisions, in a mine worked as this one was in shifts, it is provided that no place shall remain uninspected for more than five hours. The fire examiner, whose duty it was to carry out this inspection, had neglected to do so in the section where the man was employed, and the accident was caused by the accumulation of gas in the working which was ignited by a spark from a coal-cutting machine which other men were working improperly, having neglected to screw down the cover properly. The question to be decided was as follows: Was the presence of gas at the working place, which had not been discovered owing to the negligence of the fire examiner, a defect in the ways within the meaning of the Section 1, paragraph (1)? It may here be noted that the Sheriff who had tried the case had found in one of the findings of fact that "At the time of the explosion the ventilation provided failed to dilute and render harmless inflammable gas to such an extent as to make the working place in the vicinity of the top of the heading unfit for working." This, however, appears not to have been due to a defective system, but to have been a condition which might occur in a "gassy" mine, and which had to be guarded against by repeated inspections in compliance with the Mines Act. The trend of many decisions given upon this paragraph of the section has been that the defect must be of a permanent or quasi-permanent nature.

With these preliminary observations we will now turn to the judgments delivered in the House of Lords, taking first the opinions delivered by the majority who held that the man was entitled to recover the damages awarded, viz., £325. Lord Atkinson said: "In my view, therefore, there is a defect, within the meaning of section 1, subsection (1), in the condition of ways and works in a mine when from any cause they are in a condition which renders them unfit for the uses for which they are designed, to which they are intended to be put and are in fact being put." He then went on to say that it might have been expected that in the forty-three years that have elapsed since the Employers' Liability Act was passed the meaning of this subsection would have been definitely and clearly determined, yet that was not the case, and he then proceeded to examine the decided cases to show that, on the whole, they supported the view he had expressed. He found some support in the judgment delivered by Lord Watson in the House of Lords in Smith *v.* Baker (1891 A.C. 325) in which, although the crane itself in use was not defective, it was used in a manner which made the system defective, and in a dictum in Walsh *v.* Whiteley (21 Q.B.D. 378), and especially relied upon Tate *v.* Latham (1897 1.Q.B. 502) where a guard had been removed from a circular saw for his own convenience by the sawyer, and yet the absence of the guard was held a defect in an action by a workman who had fallen against the saw.

The decision in McGiffen *v.* Palmers' Shipbuilding & Iron Co. (10 Q.B.D. 5) where a

man was injured by a temporary obstruction having negligently been left in the way, Lord Atkinson considered had been wrongly decided as against the man, and Lord Dunedin agreed with this view. Lord Shaw of Dunfermline agreed with the judgment delivered by Lord Atkinson, but referred to Butler or Black *v.* Fife Colliery Co. (1909 S.C.H.L. 33), a case relied upon by the sheriff, and agreed with his finding that the presence of gas causing danger in a factory does not resemble a casual obstruction affecting the safety of ways, but at all events in a "gassy" mine is one of the dangers to be guarded against by special precautions.

In the sheriff's judgment, which Lord Shaw also expressly agreed with, was a finding that the condition imposed by subsection (2) was satisfied in that the defect was not discovered owing to lack of inspection, and lastly that under subsection 3 the burden of proving that the accident would not have been prevented lies on the person responsible.

Lord Dunedin agreed with the opinions delivered by Lords Atkinson and Shaw. It is not necessary to refer at length to the opinions expressed by the dissentient minority in the House, Lords Phillimore and Blanesburgh. It is sufficient to say they adopted the view which is strongly supported by the decided cases that the defect must be a standing defect and not of a temporary character, and there is much to be said for this view for a "gassy" mine must always be dangerous, and here all the statutory precautions had been observed to obviate that source of danger, whilst in Black's case the noxious but uninflammable gas was difficult to discover and guard against, and no safeguards were existent (Lord Blanesburgh made this point clear), therefore the accident here arose in the opinion of the minority, not from a defect under section 1, paragraph (1), which was the paragraph the House was considering.

The importance, therefore, of the majority judgments in this case lies in the fact that it gives an extended operation to section 1, paragraph (1), which coupled with Section 2, paragraph (1), imposes liability on employers in respect to the condition of the ways, works, machinery, or plant irrespective of negligence of the fellow-employees, except in so far as the latter paragraph makes it a condition that the defect arose from, or was not discovered through, the negligence of the employer or of some person entrusted by him with the duty of inspection.

"THE MITRE," OXFORD*

"A CLERK there was of Oxenford also
That unto logyk haddé long y-go,"

And Chaucer goes on to tell us that his horse was as lean as a rake and he himself anything but fat or well clothed being unbeneficed and, what's more, so unworldly-minded that—

"For him was levere have at his beddes heed
Twénty bookés clad in blak or reed
Of Aristotle and his philosophie."

We may well imagine that his bed's head may have been in the old Mitre Inn. Chaucer was writing his "Canterbury Tales" in 1386–88, and probably had in mind some such hostel as "The Mitre," which in 1364 was known as "Croxford's Inn," and perhaps in 1374 as "Dagville's Inn" although there is some slight doubt about this latter nomenclature. "The Mitre" under its present or earlier name or names, is nearly as venerable as the University. We must think of it in its youth more as a religious hostel than as a hotel, in the same sense in which we differentiate between the Inn or Tavern, and the Legal Inn.

Oxford University was a venerable institution even in Chaucer's days. It is said to have had small beginnings in or about the year 1199, when seven poor pedestrians journeyed thither with empty purses and tightened belts in the hopes of earning a livelihood by imparting crumbs of knowledge to the children of the Burghers of Oxeneford. But away down the ages from the days of the Saxon Kings it was a seat of learning under the benign influence of Alfred the Great, and from the days of the Conquest its schools were famed the worl

PRACTICAL DESIGN FOR BUILDING CONSTRUCTION.—IX.

AN ELEMENTARY EXPLANATION OF THE APPLICATION OF THE THEORY OF CONSTRUCTION TO PRACTICAL DESIGN

By EWART S. ANDREWS, B.Sc., M.I.Struct.E., A.M.Inst.C.E.

TION II.—FLOORS AND BEAMS

(Continued).

and Reactions on Beams (*continued*).

Loads and Live Loads.—In estima- e loads upon beams we divide the loads o parts.

first part is called the dead load, and s all the loads forming a permanent the structure; in the dead load must uded the weight of the floor surface ogether with any special finish, such olithic or wood-blocks in the case of e floors, plaster ceiling construction,

other part of the load is called the live nd consists in the load which may come he beam from time to time according happens to be upon the floor.

loads can, of course, be estimated with ccuracy because the weights are known ly, but live loads can be ascertained y the combination of knowledge and nt; in general, however, we are re- of the necessity of having to exhibit e combination of qualities because the fix the loads for us.

timating the live load to be taken in ith which the by-laws do not deal we remember that the load is what is he equivalent dead load, and allow- ust be made for the "liveliness" of d; loads which involve impact and n should be taken as equivalent to nore than the same loads which are ich as water in tanks.

ould here be pointed out that we use ns dead load and live load in a slightly sense from that employed in many ks on building construction; Rivington, ance, says that "live loads are those re suddenly applied or are accompanied ks or vibrations," and "dead load is hich is very gradually applied, and emains steady.

ifficulty is got over to some extent in .C. regulations by avoiding the use of "live load" and saying that the dead sists of the weight of all permanent tion and calls everything else "super- load."

Floor Loads on Buildings.

igh we design our steelwork or rein- oncrete for certain working stresses, it at all follow that they will ever be d to those stresses. It has been the since the dim past, when material our were cheap and knowledge was o err on the safe side in the matter oads coming upon buildings, and the necessary loadings have not been so that at the present time many s are capable of carrying at least three e load which they ever do carry in before the stresses reach the "safe" oon which they are designed. If we that the stresses are based upon a safety of four, we see that the real safety of the building is twelve.

ne people it may be comforting to at a building is three times as strong ed be, but an engineer should regard candal and insist upon its being taxed ury.

llowing is a summarised list of floor cified in the L.C.C. Reinforced Con- gulations, those for the steel frame buildings being the same on the whole, but divided into fewer classes.

Class of Building.	Equivalent dead load in lb. per sq. ft.
A. Domestic buildings	70
B. Hospital wards, hotel bedrooms, etc.	84
C. Offices and counting houses ...	100
D. Theatres, meetings, school rooms, etc., retail shops, workshops	112
E. Ballrooms, drill-halls	150
F. Warehouses, not less than ...	224

Mr. Fleming, of the American Bridge Company, has often written upon this important subject, which was investigated very fully by the late C. C. Schneider, of New York, who issued what are probably the most reliable specifications for floor designs. One point which Mr. Fleming makes is that there should not be a wide difference between the specified load for the same class of floors in different towns, as is at present the case in the United States.

The loads for office floors vary, for instance, from 40 lb. per sq. ft. at Milwaukee to 100 at Boston. There is not the same difference in regulations in this country, mainly because most towns do not have any.

Investigations made in 210 Boston offices showed that the highest floor load was 40.2 lb. per sq. ft.; the highest average load for ten offices was 29.8 lb. per sq. ft., and in many cases it was less than 10.

It appears to be sheer extravagance to design office floors for a superload of more than 50 lb. per sq. ft.; to meet the case of concentrated loads, such as safes, it should be specified that every floor beam of an office building should be designed for a central load of 3,000 lb. (not, of course, in addition to the superload).

The loads in any ordinary dwelling-house are much below those specified; 40 lb. per sq. ft. for the ground floor and 30 lb. per sq. ft. for upper floors are quite enough.

In this connection we will mention the question of weights of crowds; the record weight obtained by packing 67 picked Harvard engineering students into 64 sq. ft. is 160 lb. per sq. ft.; this broke Stoney's Irish labourer record of 147 lb. per sq. ft., which held the field for many years. We must not be led away too much by these figures for practical design; nobody would consent in the ordinary way to crowding to half this extent for fun, and even that extent of loading would be so unlikely to occur in a domestic building that it should be taken in as part of the factor of safety of 4 for which we design.

Hotels have slightly heavier traffic than ordinary houses, but nothing like the amounts specified; Mr. Fleming recommends 80 for the first and ground floor and 40 for other floors. The loads called for in schoolrooms are absurd; it is difficult to see how a crowd of children in a classroom can weigh as much as 50 lb. per sq. ft., let alone 112 lb.; 50 lb. is ample for design.

For theatres and churches 75 lb. per sq. ft. is sufficient, the figure being increased to 100 lb. per sq. ft. for assembly rooms where the seats are not fixed.

Many people are nervous in designing ball-rooms on account of the vibration, and think that 100 lb. per sq. ft. is too low. We know that London dancing rooms are uncomfortably crowded and that some people can be very heavy on their feet, but, allowing for the fact that the whole area of the floor is assumed to be covered, and that the dancers are willing to be so crowded that each couple has only one square yard of space, then, taking the weight of a couple as 300 lb., this only amounts to 33 lb. per sq. ft. Even if we multiply by three to allow for the effect of vibration we are still within the limit which we suggest for the design load. The student will find it interesting to estimate the total load on a ball-room floor under normal conditions of crowding; if it exceeds 20 lb. per sq. ft. we shall be surprised.

The minimum figure of 224 lb. per sq. ft. for warehouses is too small, as the load to be carried must depend on the merchandise to be stored. For light goods we think that the figure should come down to 120 lb. per sq. ft.

To deal with the difficulty that a warehouse building designed for one class of goods may be used later for another class, we would make it incumbent upon the owners to display in a conspicuous position the load for which floors are designed, and would make it an offence to exceed such load.

The Schneider Specifications.

Mr. Schneider proposed a specification for floor loadings which provides for considerable reduction in floor loads compared with British practice, and yet deals with the possibility of concentration of loads over small areas, and this seems to us to be the most rational method of procedure. The following figures are given in the Schneider specification:—

Schneider's Specification for Floor Loads.

	Distributed per sq. ft.	Concentrated.	Per ft. length of Girder.
Dwellings, hotels, hospitals, &c.	40 ..	2,000 ..	500
Offices (ground floor)	80 ..	5,000 ..	1,000
,, (upper floors)	50 ..	5,000 ..	1,000
School rooms, theatre galleries, churches	60 ..	5,000 ..	1,000
Assembly rooms, main floors of theatres, ball rooms ..	Floors 100 / Columns 50 ..	5,000 ..	1,000
Light workshops, stores, &c.	80 ..	8,000 ..	1,000
Sidewalks in front of buildings	300 ..	10,000 ..	1,000
Warehouses and factories	120 up ..	Special ..	Special

All figures are in pounds.

Example of Calculation of Loads and Reaction on Floor Beams.

As a numerical example of the methods in which the loads and reactions are calculated, we will take the portion of the floor framing of a building illustrated in Fig. 16; at a later stage we propose to continue this same example in order to work out the sizes and details of the beams and columns.

A, B —— H represent the columns by which the loads on the floors are transmitted to the foundations. The word "column" is used by most scientific engineers, although the word "stancheon" is favoured among the people in structural-steel trade; the word "pillar" is used by the London County Council in their Steel Frame Act, presumably on the delightful idea among the authorities that they would settle the confusion arising from the use of two words by introducing a third.

The floor will be assumed to be a concrete floor 5½ in. thick which spans in the direction indicated by the double-headed arrows.

The framing has been given the particular form shown in order to provide the opening indicated; for this purpose this opening is "trimmed" by the provision of a beam 8, which transmits its reactions on to beams 9, 10, which in turn transmit their reactions to beams 1, 6 and 2, 7.

The centre portion of the floor is carried by beams 3, 4, 5 which transmit their reactions to beams 9, 10 and columns D. E.

The first estimate, the load per sq. ft. for which the floor has to be designed, it being

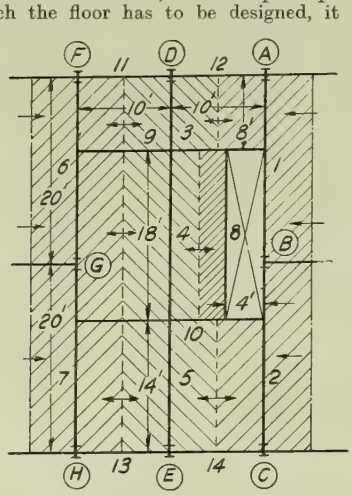

FIG. 16.

assumed that the live load is to be taken at 100 lb. per sq. ft.

We then have:

5½ in. Concrete ..	=	66
½ in. Granolithic	=	6
½ in. Plaster ..	=	6
Total dead load		78
Live load ..		100
Design load ..		178 lb. per sq. ft.

The light shading indicates the area of floor that comes on to the various beams.

We then calculate these as follows:

Beam 3. Width of floor carried = 10 ft.

$$\therefore \text{Load in tons} = \frac{10 \times 8 \times 178}{2240}$$

$= W_3 = 6.4$ tons (uniformly distributed).

$$\text{Each reaction} = \frac{6.4}{2} = 3.2 \text{ tons.}$$

Beam 4.—Width of floor carried = 8 ft.

$$\therefore \text{Load in tons} = \frac{18 \times 8 \times 178}{2240}$$

$= W_4 = 11.4$ tons.

$$\text{Each reaction} = \frac{11.4}{2} = 5.7 \text{ tons.}$$

Beam 5.—Width of floor carried = 10 ft.

$$\therefore \text{Load in tons} = \frac{10 \times 178 \times 14}{2240} = 11.1$$

Each reaction = 5.5 tons.

Beam 8.—Width of floor carried = 3 ft.

$$\text{Load in tons} = \therefore \frac{3 \times 178 \times 18}{2240} = 4.3$$

Each reaction = 2.1 tons.

Now take beams 9 and 10. Beam 9 has a load W_1 at the centre which is equal to the sum of the reactions from the beams 3 and 4 and also has a load W_2 equal to the reaction from the beam 8. From the above figures we have:

$W_1 = 3.2 + 5.7 = 8.9$ tons.
$W_2 = 2.1$ tons.

Fig. 17 shows the loads on the beam 9.

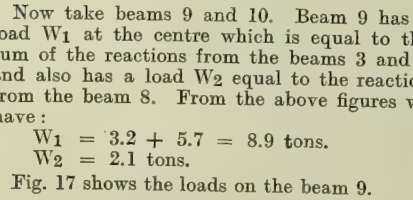

FIG. 17.

We have now to find the reactions R_1, R_6, at the points 1 and 6.

To find R_6 take moments about the point 1:

Moment of W_2	=	$2.1 \times 4 = 8.4$
W_1	=	$8.9 \times 10 = 89.0$
Total moment		97.4

This must be equal to the moment of R_6., about 1, *i.e.*, $R_6 \times 20$.

$$R_6 \times 20 = 97.4$$

$$R_6 = \frac{9714}{20} = 4.9 \text{ tons}$$

Total weight $= W_1 + W_2 = 11.0$
$R_1 = 11.0 - 4.9 = 6.1$ tons

Working in a similar manner for the beam 10 we should get:

$R_7 = 6.0$ tons
$R_2 = 7.3$ tons

The reader is recommended to test this as an exercise.

We will now find the loads and reactions on one of the main beams, such as C.

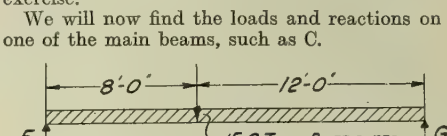

FIG. 18.

It has a point load of 4.9 (the reaction from beam 9) and a uniformly distributed load from the floor slab. This uniformly distributed load

$$= W = \frac{10 \times 20 \times 178}{2240} = 15.9 \text{ tons}$$

Taking this as acting as the centre of the beam, we take moments about the point F with the following results:

Moment of—		
Point load	$= 4.9 \times 8$	= 39.2
Uniform ,,	$= 15.9 \times 10$	= 159
Total moment		178.2 ft.-tons

$$RG = \frac{\text{Total Moment}}{20} = 8.9 \text{ tons}$$

The total load = 4.9 + 15.9 = 20.8 to

Reaction at F = 20.8—8.9 = 11.9

The reactions in the other main b found in a similar manner and the loa mitted to the columns are then det as a check on the accuracy of the wo should always see that the sum of all th loads is equal to the total load on th ponding portion of the floor.

Ormiston War Memorial.

The Marquis of Linlithgow recently a war memorial and opened a welf memorial institute at Ormiston. In the institute is the war memorial, whi the form of a polished stone shaft wit capital. The base bears on its front tablet with the memorial inscription bronze figure representing "The Sac Youth" surmounts the shaft. The was Mr. J. A. Carfrae, Edinburgh.

Steel Houses.

The Sub-Committee on Sites and H Glasgow Corporation Housing Co recently decided to authorise the Dir Housing to have 10 steel houses of t proposed in the offer of Lord Weir er an experiment on ground belonging department at Drumoyne. The sub-co also agreed to erect on the ground set a experimental purposes at Drumoyne a in timber consisting of a block of four h

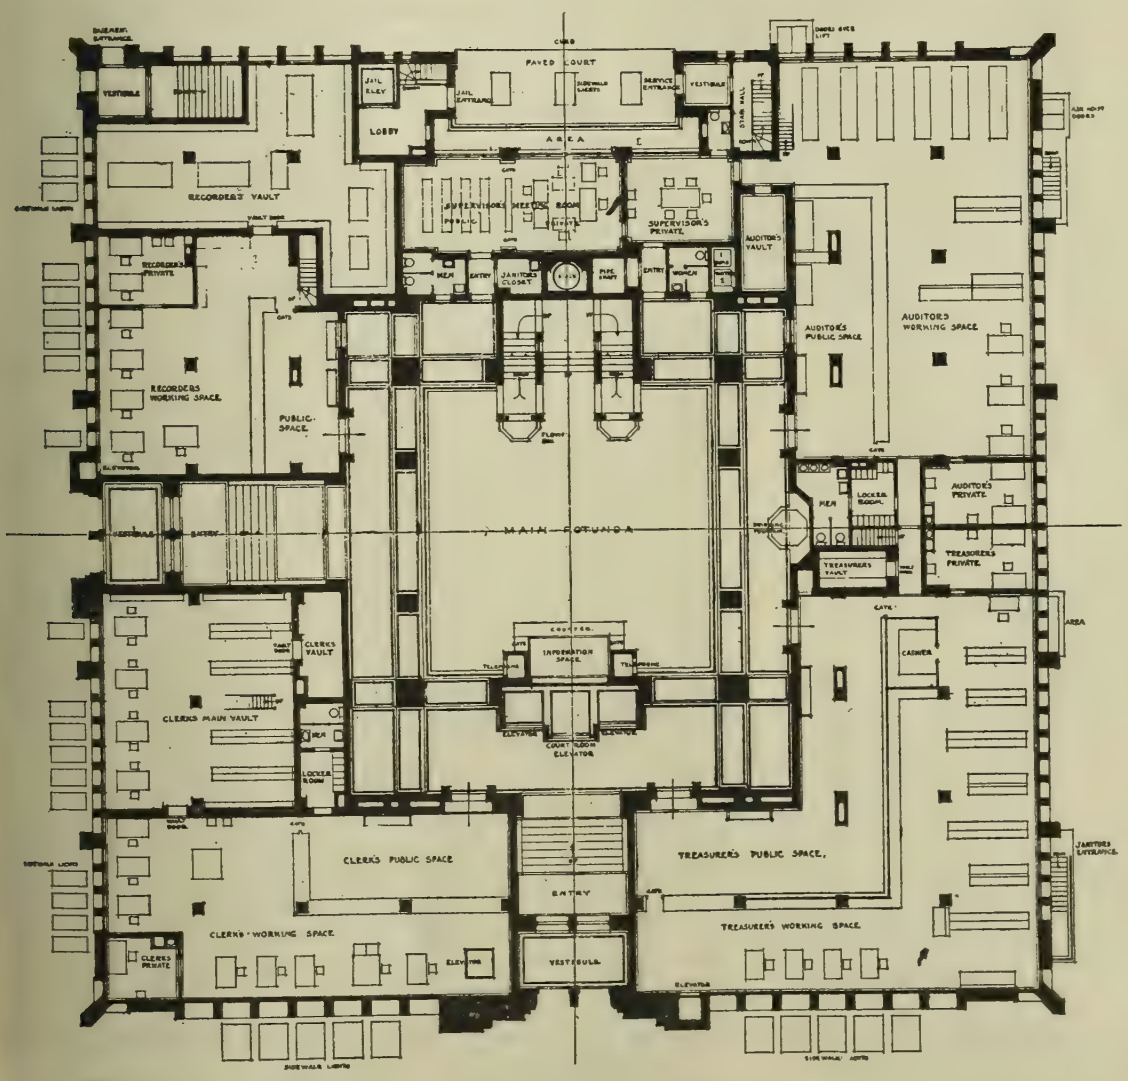
Bristol architecture iated with some well-known men, Sir nbrugh himself having built a Palladian King's Weston House, which sufficiently is his reputation as a designer with a and.



ntroduction by Mr. J. E. Barton dis- he spiritual status of these orderly f the eighteenth century, which was, s, "a period of equilibrium between the antic spirit that had passed away with rts, and the new imaginative life that ollow the French Revolution. Peaks sses of emotion—the mysticism of great es or poets—were outside its experience rt.

ould not have produced a Shakespeare nor a Shelley. The fastidiousness of Addison, the wit of Pope, the ease of Goldsmith, and the common sense of Johnson are typical of its mental quality and range. Eighteenth-century work as a whole, in all its degrees from honest competence to exquisite mastery, is marked by consistent care and thoroughness. Clear principle and solid practice marched together; and where the practice fell short, a recognised standard of criticism was always at hand to detect the flaw."

The absence of such instructed criticism at the present time, and, indeed, of any real popular interest in architecture at all, is deplored by Mr. Dening, who sets himself to stir up interest in his opening chapters on the study of architecture and craftsmanship. How far a brief resumé of architectural evolution can achieve this end is rather doubtful. Can it be useful to inform the reader that "a glance at the plans of Egyptian and Grecian temples will reveal the contradistinction between the two"—and omit to print the plans? Or to repeat the old familiar statements about the darkness and awe of Egyptian buildings with their "austere and forbidding aspect," when we know that their simple expanses of wall surface were but the basis for the gayest imaginable colour decorations, and that in the intense sunlight and under the vast equalising sky of Egypt even the heaviest structures are apt to appear dwarfed, and, in contrast with the limitless horizon, insignificant? The "austerity" of Egyptian art may be apparent in the dim light of the British Museum or in the crudely exaggerated shadows of an ill-developed photograph, but it is by no means noticeable on the spot.

It is a far cry from Beni-Hassan to Bristol, and in spite of several sage remarks contained in the first two chapters it is a pleasure to pass on to the excellent subject-matter in the later pages, where admirable art is matched with pointed and pertinent comment. The desirability of a central feature in the side of St. James's-square, and the absurdity of a sham feature with a pediment shared in equal halves between two different owners who each paint "their own portions their own particular colour" is very properly emphasised in text and illustration. The value of well-proportioned panes of glass, and the damage done to a dignified front by the removal of sash bars, is pointed out on more than one occasion, and it is to be hoped that the mania for dark expanses of plate-glass may be mitigated by these timely warnings. "Outside the profession," writes Mr. Dening, "it is not generally recognised how much of the effect relies upon the proper proportion of a pane. It is the unit that controls the design of the window opening, and from Sir Christopher Wren downwards it has received considerable attention."

The beauty of old crown glass with the exquisite iridescence in its rippled surface is shown in many of the illustrations, and the recent revival of the eighteenth-century manner without the brilliant colouring picked out upon the glass can never be quite so satisfactory in appearance. A comparison of the Bristol Exchange in its present state with the sash bars

cut out and the old glass replaced with large gloomy slabs of new, with the façade of the Royal Fort, where both bars and old glass remain, should convince any reader of the superiority of the older way.

Some fine staircases with bracketed treads and twist-turned balusters are detailed and described, and the characteristic Bristol bracketed and niche headed entrance doors appear on several of the plates. A magnificent mantelpiece attributed to Grinling Gibbons is illustrated in Plate XXIII. The ornament, which has the lightness and buoyancy of Gibbons' work in limewood, is actually carved in solid blocks of oak. Other elaborate wood carvings are shown in connection with the Bristol churches where some sumptuous panelled reredoses have been preserved. Some of these have their central panel occupied by pairs of tablets inscribed with the Commandments. Mr. Dening remarks: "It is strange that this treatment occurs in each instance. The object of a central feature—the focal point of a design—has been defeated by introducing this central division." Historical reference to the stone tablets of Sinai seems to have been allowed to take precedence over considerations of design.

A chapter on metalwork is illustrated with photographs of some beautiful wrought-iron gates; a sword-rest and some area-railings of very charming quality and other examples are referred to in the earlier parts of the book.

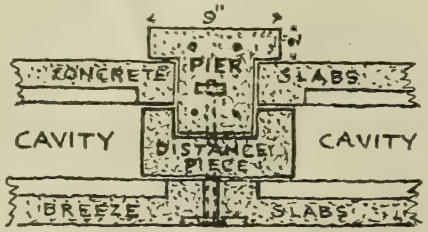
Efflorescence on Brickwork.

[Reply to Mr. Richardson.]

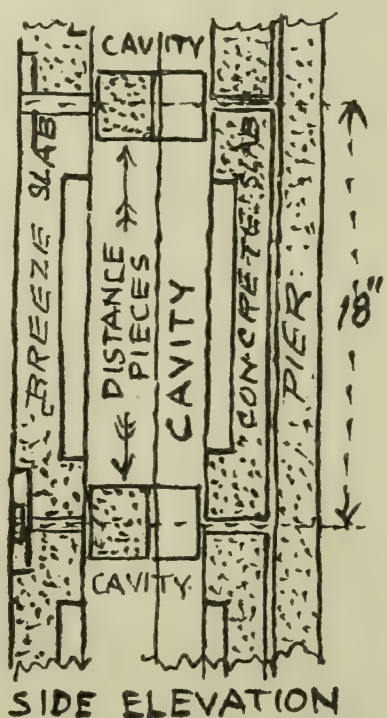
Mr. Richardson quite correct in e trouble "efflorescence"? The nat works through in the walls of his ubtless from without, and due to the ving been killed by the frost before The cure is to seal the outer surface s, which will then dry out in a short he change from the good to the bad convenient place, such as not far ground floor window cills, it might effective way if the defective portion or so above were rendered over with pfed cement, in the form of a plinth. ly it might answer the purpose if the he defective portion were raked out and carefully re-pointed in cement, and the wall surface washed over with a colourless water-proofing solution of good make and mixed strong. If the trouble were really efflorescence, and due to the presence in quantity of salt in the body of the wall, either in the bricks or the mortar, (as occurs when sea sand or "below bridge" Thames sand is used), then the remedy is to seal the inner face of the wall, for it is practically impossible to eradicate the salt, and it but remains to keep it in its place.

"Incrustation."



Cavity Walls and Laying of Bricks.

[Reply to "Tradition."]



Sir,—With reference to *The Builder* of the 19th instant, referring to cavity walls, the concrete slab system I had in mind also has a cavity, both horizontally and vertically, except for the 3 in. by 2½ in. distance-pieces of super cement (damp-proof), which are secured to the reinforced super cement piers at 18 in. centres.

A house of this description was built at Shoeburyness in 1920 by the War Department, within 1,000 yards of the firing range of the 15 in. guns, and although the concussion caused by the firing of the very heavy guns is enormous, and the house situated in a very exposed position, it is still as good as the day it was built, and absolutely bone dry. It would require a very good brick house to stand the above conditions.

PLAN OF PIER, OUTER SLABS DISTANCE-PIECE & INNER SLABS

SIDE ELEVATION

(See Letter by W. F. Kennelly.)

Concrete Blocks.

[Reply to "Surveyors."]

Sir,—I think it is generally admitted that, unless concrete blocks are actually cast on the site, there is no saving over the cost of brickwork in walling for small housing work; in fact, rather the reverse, if really satisfactory concrete is used.

There are so many interruptions in the way of quoins, window and door jambs, and breaks and returns in a small house, that the small easily handled brick, easily cut and snapped to shape to meet individual eventualities, is bound to hold its own over all comers. For large uninterrupted stretches of walling it is another matter, but where there is a large proportion of special made blocks, the concrete block does not really get a look in. "Convinced."

Right of Light.

[Reply to "Surveyor."]

Sir,—"Light and Air," by Sir Banister F. Fletcher, is a very comprehensive work, in which I feel sure your correspondent will find all the information he may require on this subject.

His question covers much too wide a field to deal with in the limits of a short letter.

"Authority."

Sir,—There does not appear to be any recognised method of valuing loss of light coming to the dominant tenement; nor do the standard works on the Law of Light suggest definite working rules that may be used to ascertain the value of the injury. When valuing the injury it should be borne in mind (1) that the dominant tenement is only entitled to such an amount of light as is necessary, according to the ordinary requirements of mankind, for the use and enjoyment of the house as a dwelling-house, if it be a dwelling-house, or for the beneficial use and occupation of the building if it be a warehouse, shop, or other place of business; (2) that there is no fixed test as to amount of light to which a dominant owner is entitled, and that to interfere must amount to a nuisance; (3) that the Court will not necessarily allow a defendant to pay damages for his wrongful interference with the plaintiff's light, since it will not allow a wrong to continue simply because the wrong-doer is able and willing to pay for the injury he may inflict; (4) that, however, when the injury is small, and is capable of being estimated in money and is one in which it would be oppressive to grant an injunction, then damages in substitution for an injunction may be given.

The questioner, applying the ordinary rules of valuing property to arrive at the value of the injury, should consider: (*a*) does the obstruction lessen the letting or selling value of the property; (*b*) is the convenience or comfort or business of the dominant owner interfered with, and, if so, to what extent they be remedied and cost of such remedy ?

Combe's "Law of Light," and Banister Fletcher's "Light and Air" might be consulted.

C. T. W.

External Oak.

[Reply to "F.S.A."]

Sir,—I do not know of any transparent and colourless preservative for oak, but I do know that English oak is probably the most durable building material we have, excepting granite and some similar stones, and I should not personally hesitate to use it, even in London, without any preparation whatever. The timber, if in large scantlings, will crack, and quite large fissures will occur; but there is no danger to be feared. There is many an old oak tree standing to-day, cracked from top to bottom, but quite healthy after many centuries.

"Nature."

THE BUILDING TRADE

WORKMEN'S COMPENSATION

CASE UNDER THE NEW ACT

An important decision has been given by the Court of Appeal in the case Davies *v.* Gwauncaegurwen Colliery Company, Ltd. (*The Times*, July 24), on the new Workmen's Compensation Act, 1923, section 7, which provides "For the purposes of the principal Act an accident resulting in the death, or serious and permanent disablement, of the workman shall be deemed to arise out of, and in the course of, the employment, notwithstanding that the workman was at the time when the accident happened acting in contravention of any statutory or other regulation applicable to his employment, or of any orders given by, or on behalf of, his employer, or that he was acting without instructions from his employer, if such act was done by the workman for the purposes of, and in connection with, the employer's trade or business."

The applicant in the case was the widow of a man who acted as a screensman in the Mardy Colliery, and whose employment it was to work on the front part of screens for loading railway wagons. The rear part of the screens had been disused for some ten years. There were two cabins provided for the men to hang up their coats and to leave their food in, and there was no necessity for any of the men to go to the rear of the screens, but this man, who was an old servant of the company, had made it his practice to go into the disused part behind the screens, hang up his coat there, and later to eat his food there. This practice of his was known to the officials, but he was the only workman who did it. A few days before the accident a barrier of railings was put up to prevent any man from going into the disused part behind the screens, as it was considered dangerous, but the man must have continued to do so, although he had been warned not to do so by the carpenter who had put up the barriers, for, on February 13, having arrived at the pit before daylight, he was found down a hole 19 ft. deep in the disused part, and he subsequently died of the injuries he had received. The County Court Judge in these circumstances had held that the accident did not arise out of and in the course of his employment.

The Court of Appeal affirmed this judgment, and considered the effect of this new section. The court observed that the section was not very happily worded, but it was important to note that it introduced a new phrase, "the employer's trade or business," and the act done by the workman when he met with injury by accident must fulfil both limbs of the last sentence in the section, that is to say, unless the act was done for the purposes of, and in connection with, the employer's trade or business, it was not an act arising out of the employment. This principle was not satisfied in this case, for the workman was acting entirely for his own purposes in entering the disused portion behind the screens.

It may be noted that the Master of the Rolls, while saying that it was doubtful whether it would be wise at this early stage to apply any particular construction to the section, did give some intimation as to its probable intention. He is reported as having said the section was probably intended to apply to such a case as Bourton *v.* Beauchamp (1920, A.C. 1,001; *The Builder*, June 25, 1920); but it was more doubtful whether the section applied to such a case as Lancashire and Yorkshire Railway *v.* Highley (1917, A.C. 352; *The Builder*, April 6, 1917), although in the notes to Chitty's "Statutes" it was suggested it did so apply.

In the first of these two cases a man employed to attend the cages at the bottom of a mining shaft, in contravention of a regulation made under the Coal Mines Act, while the cages were working, crossed the shaft bottom and noticing that a sumph board was loose, stopped to knock it into place, which it was part of his duty to do when the cages were not working, but he himself had signalled for the cage to descend. Under the old Act, the House of Lords held the accident not to have arisen "out of and in the course of the man's employment, as this man had acted contrary to a statutory order; but under the new Act, the act done by the workmen would be one done by the workman "for the purposes of and in connection with his employer's trade or business." We pointed this out in our article of December 28, 1923, when the Bill first became law.

In the second case a workman in the employ of the railway company had been ordered to go to Goole, and whilst on transit he had to wait half an hour at Wakefield station, and whilst there crossed the line to get some hot water to make tea for breakfast, and was killed by a train. This was held by the House of Lords not to be an accident arising out of and in the course of the employment, as the man had taken an additional and unnecessary risk upon himself. It would appear that the result would be the same under this new section for the man in crossing the line, instead of using the bridge, was not acting, for the purposes of, and in connection with, his employers' trade or business, but taking a short cut for his own convenience.

Broadly speaking, therefore, the new section seems to apply to those cases where the Act is confined to furthering the employers' interests, though in contravention of a statutory, or other order, or without directions, but as we showed in our recent note on St. Helen's Colliery *v.* Hewitson (1924 A.C. 59; *The Builder*, April 25, 1924) where the meaning of the words "out of and in the course of the employment" was discussed at length by the House, the same sort of questions may arise under the new section as have arisen under the old Act where men, though not actively engaged in work, are still acting within the scope of their employment. Lord Atkinson gave examples of this such as haymakers going a short distance to get water to drink to enable them to continue their work, workmen taking food on the premises or standing by, for in such cases if a man is acting contrary to orders, or without directions but not for his own purposes, it will still have to be determined whether he was not acting indirectly for the purposes of, or in connection with, his employers' trade or business.

The wording of this new section, however, appears to give rise to another consideration with reference to the Act itself, for it seems a question whether the definition it contains in the last part of it, of the scope of a man's employment, could not be adopted in the Act with advantage in place of the expression "arising out of and in the course of the employment," which has proved so very difficult of interpretation and application.

It is true the Committee which sat in 1920 recommended no change in this expression, as it considered it had been defined by judicial decisions, but since then numerous decisions in the House of Lords have again altered the interpretation to be put on this expression, and have showed the extreme difficulty of suggestion tests for its application.

The Act would then read, "If in any employment personal injury by accident is caused to a workman whilst acting for the purposes, and in connection with, his employer's trade or business . . ." and these words supply a definite test easily determined as a question of fact. As the law stands at present this test is only applied in cases resulting in death, and serious and permanent disablement, and where the man is acting contrary to orders or without direction, whereas in all other cases the meaning of the expression "Out of and in the course of the employment," has to be deter the light of the many conflicting ca think the amendment of the Act by th adoption of the expression now used in section, either by itself or as in the se combination with the words "out of a course of the employment," would ve simplify the administration of the Ac in no way limiting its scope.

REINFORCED CONCRETE AND ITS LATION TO CONSTRUCTIONAL STEEL

e course of a recent lecture before the of the Institution of Civil Engineers, Whitridge Davies, B.Sc., A.C.G.I., value of a-building material depended e extent to which it possessed certain , the most important of which were: ngth, (2) resistance to fire, (3) re- to corrosion, (4) resistance to wear, ity in design, (6) facility in construc- æsthetic possibilities.

rced concrete was a good fire-resist- erial for two reasons: first, because ductivity of concrete was low, and heat travelled slowly from one part er; second, because the coefficients of n of steel and concrete were approxi- he same, so that no internal stresses up due to unequal expansion. The heat on concrete was to cause it to ate and "spall," but owing to its uctivity this action was generally con- a small surface layer. Unprotected attacked by fire, was the most un- and treacherous material used in construction; owing to its relatively ductivity the effect of heat spread ver a structure, with disastrous re- ts stability. Steelwork could only be ctively fireproof by being coated with a or concrete or some other non- g substance, which added consider- the dead weight without increasing gth of a member. In this way it unfavourably with reinforced con- in the case of the latter the concrete a double rôle, both protecting the playing an essential structural part. e, like stone and brick, was a inert substance, and therefore suf- y little from corrosive action. It ected by water. Some acids affected most cases the reaction was not slow, but resulted in the formation ective coating which prevented fur- k. With a good hard, dense con- e was little chance of corrosion oc- Steel, on the other hand, was much nically active, and therefore more corrosion. Its failing in this s too well known to need descrip- ce to say that the discovery of a nd stronger form of rustless steel of the greatest value, and un- would have the effect of lessening tance of reinforced concrete as a aterial, for resistance to corrosion ost valuable property of the latter. e question of resistance to wear d it was found that the position of terials is reversed; steel was able d the heaviest wear to which a liable, whereas concrete was not resistant. The greatest cause of in concrete was the occurrence n the presence of water. Cracks es were of no consequence if water sent, but the presence of the two most inevitably resulted in dis- These cracks might be caused erent ways: by shrinkage during f the concrete, by expansion and due to changes of temperature, e due to alternate wetting and y the presence of excessive tensile t first they were only fine hair- as soon as water was allowed to xpand—either by freezing or by n—the interstices became wider the entrance of further water. ion was accumulative, and might in the falling away of large por- work. No entirely satisfactory yet been devised for this ill, but duced to a minimum by avoiding ges of section, and where large urred by providing a light mesh to take up the shrinkage

Facility in design involved two main considerations: the accuracy with which the stresses due to a given condition of loading could be determined; and the economy with which these stresses could be resisted. With regard to the first consideration, owing to the monolithic nature of reinforced concrete the computation of stresses was a somewhat involved process. In steelwork design no continuity was assumed to exist between member and member, and although that implied a loss of economy it also meant that the stresses in each member could be calculated with greater accuracy and therefore that the factor of safety might be proportionately smaller. Given, however, a certain stress to be resisted it was possible in the case of reinforced concrete to adjust the size and strength of the member to suit the exact requirements, thereby securing the maximum economy. Constructional steel, on the other hand, being rolled in a limited number of shapes and sizes, could not always be designed so near the required strength. This might at first sight seem to be a trivial inconvenience, but that it was really of some importance was shown by the recent introduction of new British Standard sections with a view to filling some of the gaps in the old table.

There were many factors which determined the suitability of a material for construction purposes, but the more important ones were: ease in handling; accuracy of workmanship; skilled labour required; and speed of erection.

In these days of expensive labour the ease with which a material could be handled was a very important consideration. In this respect reinforced concrete did not compare favourably with steelwork, for besides being heavier it could not so easily be handled by mechanical means. Steelwork units were lighter, involved only one material, and could be easily manipulated by means of a crane; they could also be assembled in the shops and stored there until required for erection, thus avoiding unnecessary transportation. Up-to-date methods in concrete construction employed mechanical mixers, metal formwork, and chutes for distributing the concrete to the forms, but even with these improvements a large amount of labour was required which was unnecessary in steel construction.

It had often been asserted that a large proportion of unskilled labour could be utilised in reinforced concrete work, but the truth was that good work could only be performed by men with the necessary knowledge and skill. But although skill was certainly required the training of men to the necessary degree of aptitude was not a difficult task. In this respect it compared favourably with steelwork construction which, from the very nature of the material, involved the employment of a specialist firm.

Architectural effect was controlled mainly by three elements: colour, texture and form, and it was through these that a structure must appeal to the eye. Reinforced concrete, if properly employed, was capable of æsthetic treatment in all three respects. Its colour was normally that of natural stone, but could be altered at will by introducing permanent pigments during mixing or by using naturally-coloured aggregates. In texture, too, it was similar to masonry, but, as with colour, it was capable of infinite variations; a number of different means were employed for obtaining the required texture, from rubbing with carborundum for fine effects to bush-hammering for coarse effects. Concrete could also, within reason, be moulded to any desired shape, and although a limit was imposed in such treatment by the difficulty of constructing the formwork, it was far easier to obtain æsthetic effect with concrete than with constructional steel. Steelwork had no colour except what was given it by paint, and that soon dulled and tarnished; its texture was smooth and uniform and could not be altered by surface treatment; it could not be moulded, but must rely for its effect upon the use of standard sections, which might be structurally efficient, but were certainly not beautiful.

The chief advantages of reinforced concrete compared with constructional steel were its resistance to fire, resistance to corrosion, and æsthetic possibilities; while the advantages of steel were its lightness and its facility in construction.

All commercial buildings of any size were now constructed as frame buildings; in essence they consisted of a steel or reinforced concrete framework composed of beams and columns, and floors and wall panels which rested upon this frame.

The main strength of a reinforced concrete framework lay in its monolithic nature. That ensured rigid connection between beams and columns, and not only resulted in a more even distribution of stresses due to vertical loads but also caused the whole frame to act as if it were diagonally braced when subjected to lateral wind load. A steel framework, being designed with cleat connections, which approximated to pin-joints, and through which no appreciable stress could be transferred from one member to another, was less rigid and therefore in that respect less strong. The rigidity of a concrete framework was not confined to the framework only; the floors, and sometimes the walls, were constructed monolithic with the beams and columns so that the whole structure was knit into one solid, elastic, continuous mass.

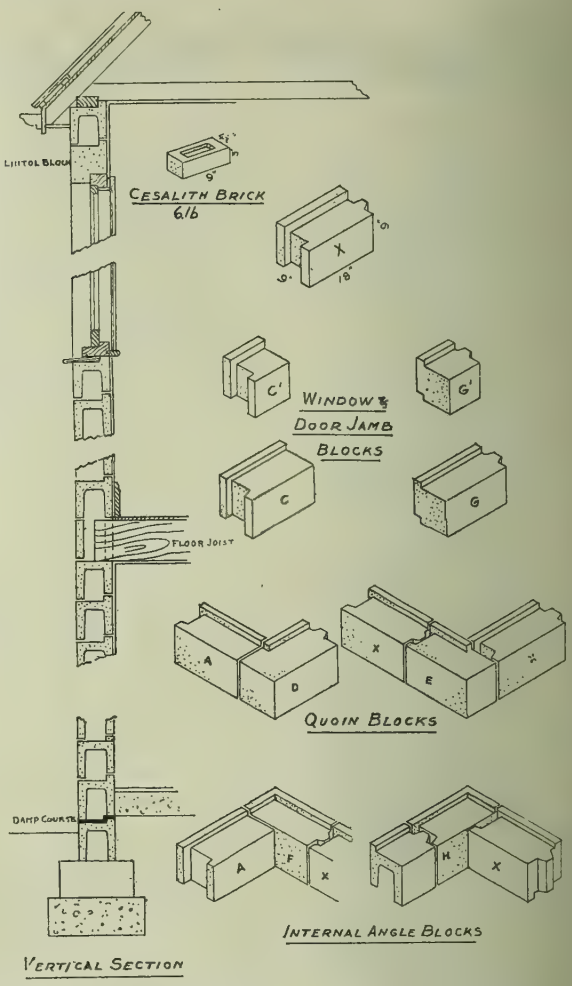
Coming to the question of resistance to fire, as all building regulations insisted on the adequate protection of steelwork by some form of concrete or terra-cotta, there was little to choose between the two forms of construction, except on the ground of economy. In the case of reinforced concrete the concrete played an important part in the structural strength of a member, whereas in constructional steel it functioned merely as a protecting material. More notice was now being taken of the fact that the concrete actually did considerably add to the strength of the beam or stanchion it encased; a joist embedded in a concrete floor would safely support a 50 per cent. greater load if the strength of the concrete were taken into account, and in the case of stanchions that increase might be as much as 100 per cent. An interesting example of the efficiency of concrete as a fire-proof material occurred at an hotel in Minneapolis. A fire broke out on the eleventh floor of the building, and attained such a degree of heat that the plaster crumbled and the iron fixings melted. In spite of this the reinforced concrete walls and floor were able to confine the fire so effectively that many of the guests below were unaware of what was occurring.

It was necessary in the case of a steel frame building to use some sort of facing, but reinforced concrete, being a material possessing the appearance of natural stone, should not require a veneer. Many buildings had already been erected in which concrete was the only material used, the concrete being treated architecturally with great success. No doubt, as the surface treatment of concrete was more universally employed and as our general knowledge of the material increased a style of architecture suited to its own particular properties would gradually be evolved, and buildings constructed entirely of reinforced concrete would be much commoner than they were to-day.

Messrs. Bivert & Firth have recently issued a brochure, "Celatexed Roofs," which contains useful information concerning the construction and upkeep of roofs. It deals with the water-proofness, strength, efficiency in practice, availability, and reasonableness of costs of "Celatexed" Roofs, and should, therefore, prove of interest to architects. Copies can be obtained on application from Messrs. Bivert & Firth, Cunard House, 27, Cockspur-street, London, S.W. 1.

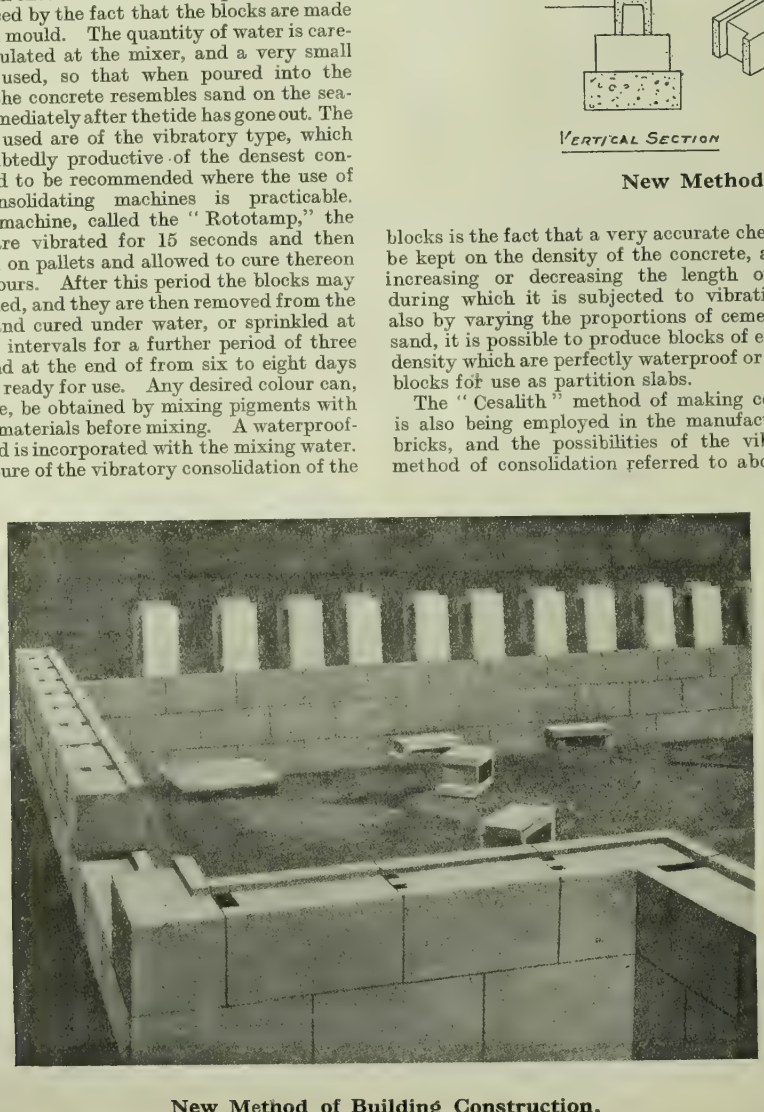
NEW INVENTION

New Method of Building.



"CESALITH" is the name given to a new system of hollow wall construction about to be put on the market by Mr. Bruce Brown, M.I.Struct.E., of 150, Southampton-row, W.C.1, which is of particular interest on account of the method of manufacture. "Cesalith" is a synthetic sandstone rather than concrete as generally understood. The walling is formed of hollow blocks measuring 18 in. by 9 in. by 9 in., and weighing about 40 lb. each, and are thus easily handled while equal in size to 12 ordinary bricks. As shown in the illustrations, the blocks are of hollow formation, with plain sides, a groove at one end and a tongue at the other, a top piece which is flat on top and shaped to a parabolic arch inside, while the bottom of the block is left open. On one side of the top of each block is a flange, and the blocks are so laid that in each course the position of this flange is reversed; thus, on the bottom course the flange will be on the outside of the wall, while in the next course it will be on the inner surface. By this means, as is shown in the illustration, a continuous longitudinal air space is formed throughout the walling at each block course, which, by keeping the temperature of the outer and inner faces of the wall more equal acts as a preventative against condensation.

It is, however, in the method and materials of manufacture that the chief novelty of the system lies. The mix used is in the proportion of one part Portland cement, eight parts sand, and one part chalk, the absence of coarse material making an excellent surface finish possible, which is enhanced by the fact that the blocks are made in a steel mould. The quantity of water is carefully regulated at the mixer, and a very small amount used, so that when poured into the moulds the concrete resembles sand on the seashore immediately after the tide has gone out. The machins used are of the vibratory type, which is undoubtedly productive of the densest concrete and to be recommended where the use of such consolidating machines is practicable. In this machine, called the "Rototamp," the blocks are vibrated for 15 seconds and then removed on pallets and allowed to cure thereon for 12 hours. After this period the blocks may be handled, and they are then removed from the pallets and cured under water, or sprinkled at frequent intervals for a further period of three days, and at the end of from six to eight days they are ready for use. Any desired colour can, of course, be obtained by mixing pigments with the dry materials before mixing. A waterproofing liquid is incorporated with the mixing water.



A feature of the vibratory consolidation of the blocks is the fact that a very accurate check can be kept on the density of the concrete, and by increasing or decreasing the length of time during which it is subjected to vibration, as also by varying the proportions of cement and sand, it is possible to produce blocks of extreme density which are perfectly waterproof or porous blocks for use as partition slabs.

The "Cesalith" method of making concrete is also being employed in the manufacture of bricks, and the possibilities of the vibratory method of consolidation referred to above are made use of to produce anything from brick to an engineering brick at will by the density of the concrete. These br be economically made wherever suitable available at, we are informed, a con price with clay bricks. They are mad a time in a "Rototamp" machine, and five seconds is necessary to consolidate is claimed that it is possible to produc 600 bricks per hour on a building site, or of 5,000 per day per machine in a fa battery of 20 machines would thus b turn out 100,000 bricks per day.

We are informed that a house built a more Hill two years ago with this s concrete blocks shows no trace wh dampness or condensation, even in the and kitchen. A saving of one-sixth or cost of a house is claimed for the " method compared with brick construc

New Method of Building Construction.

New Method of Building Construction.

Building in Egypt.

£E.201,000 has been allotted for the of Suez Harbour, and £E.20,000 for the Customs House at Port Said.

Building in Japan.

The Acting Commercial Counsellor reports that a Japanese Ministry of t Ordinance was published recently rela grant of subsidies for the constructi proof buildings in certain zones in To Kanagawa Prefectures. It is state public expenditure involved will r 20,000,000 yen. A translation o portions of the Ordinance with e notes appended by the Acting Counsellor indicating the nature of th to be given and the types of buildin may be consulted by United Kingd application to the Department Trade, 35, Old Queen-street, S.W.1. C.X.1171).

HE SCOTTISH BUILDER

HE GOVERNMENT'S USING SCHEME—THE COTTISH CIRCULAR

full terms of the Government's housing are set out in a circular which the Scottish of Health issued recently to the local ties in Scotland. The circular generally the lines of the recent circular issued by glish Ministry of Health, but there are modifications in the Scottish scheme. ost important of these are the definition rural area" in Scotland, the decision of ard to issue model plans, &c., and the limitations which the Board put on their ion to build houses smaller than the standard.

introduction explains that the primary of the Act is "to establish continuity ing with the housing problem and, by option of a long and continuous pro- e of building, to ensure such a develop- all the resources of the building industry guarantee the production of houses on sufficient to overcome the present shortage of houses, and to make adequate on for meeting the growing need and replacement of unsatisfactory accom- on." The circular goes on to explain the of the scheme and the administrative ements for carrying it out.

The Subsidy.

main points are as follows:—

es which comply with special conditions of letting and amount of rent), and are completed before October 1, 1939, provided by a local authority, be eligible Government subsidy of £9 a year for ears; or, if the house is situated in a area," £12 10s. a year for forty years. dy is also payable by the local authorities vate enterprise. The amount of such , which must take the form of an annual t for a period not exceeding forty s a matter for the determination of each thority, subject to the approval of the Board of Health. If the local authority private enterprise less than the amount £12 10s., as the case may be, the amount Exchequer contribution to the local y will be reduced to the equivalent local authority's grant. A "rural in Scotland for the purposes of the osely defined. In general terms it may ribed as a landward parish (or the part of a parish) in which the value gricultural land exceeds 25 per cent. tal valuation of all lands and heritages, which the population is less than fifty per hundred acres; and any area an a burgh) within the Highlands and Medical Service area.

rates apply to houses built only during two years. After October 1, 1926, and o years thereafter, the contribution for uilt during the next two years may be f the cost of building and other condi- rant a reduction.

Type of House.

reased subsidies apply to houses having ial area within the following limits:— ried cottage:—Minimum 620, maxi- superficial feet.

ried cottage or bungalow, or house in tenement:—Minimum 550, maximum ficial feet.

s a provision which empowers the permit smaller houses, having a size of 570 superficial feet for two- tages and 500 superficial feet for one- tages or flats. But the circular states ore permitting any houses of the mensions the Board will require to be hat the circumstances of the area are exceptional as to warrant departure from the general standard, and in no case will the number of smaller houses in any one development be allowed to exceed 25 per cent. of the total number of houses included in that development."

The density of the houses, unless in exceptional circumstances, must not exceed 8 per acre in a "rural area" and 12 per acre elsewhere.

Freedom to the Local Authorities.

The Board propose to leave the details of the schemes, so far as practicable, within the discretion of the local authorities, and save in exceptional circumstances, the local authorities need not submit plans, specifications, &c., tenders or contracts for the Board's approval. The Board's officers, however, are at the disposal of the local authorities for consultation.

The Board's approval normally will be given in two stages, first, general approval to a programme for two years, and second, specific approval to the building of houses which are to be put in hand at once and which are likely to be completed within nine months. The local authority's proposals for provisional approval are to be submitted with a statement setting out, among other things, the shortage of houses in the area, estimates of the number of houses likely to be built by the local authority and by private enterprise, the present labour position in the area, and an undertaking by the local authority that, where they apply, the special conditions will be strictly observed. The main point in the application for specific approval is the local authority's estimates of costs (houses, lands and roads) and the anticipated date of completion of the houses.

Board to Issue Model Plans, &c.

The Board are preparing model plans, specifications, and schedules which embody the numerous economies which the Board have found to be practicable during their experience of the housing schemes of the last five years. These plans, &c., will be put on sale through H.M. Stationery Office.

Rents.

The special conditions which must be observed in order to qualify for the increased subsidy include, among other things, requirements that the houses will be let to tenants who intend to reside in them and that reasonable preference will be given to large families. The rents clause of the special conditions is as follows:—

"That the rents of the houses will not in the aggregate exceed the rents payable if the houses were let at the appropriate normal rents charged in respect of pre-war working-class houses, except in so far as the expenses to be borne by the local rate would exceed the equivalent of £4 10s. a year per house for 40 years, and that no fine, premium or other like sum shall be taken in addition to the rent."

This makes it clear that the local authority can charge a higher rent than the ordinary rent for pre-war working class houses only if the loss to the local authority exceeds £4 10s. per house, which is the amount of the local authority's contribution to be added to the Government contribution of £9 for a house in a non-rural area of £12 10s. in a rural area.

The provisions of the 1923 Housing Act so far as Exchequer contributions are concerned are extended practically unaltered for 15 years, so that local authorities if they do not want to comply with the special conditions may continue to build themselves or assist private enterprise on the basis of the 1923 Act. The Exchequer contribution under that Act is limited to £6 a year for 20 years. A significant modification, however, is that which requires that the fixed bath must be provided in a bathroom.

The 1924 Act generally continues in force and makes permanent the temporary provisions of the Act of 1923, which authorised local authorities to lend money to builders and building societies for houses up to an estimated value of £1,500.

New Building Methods.

There are several references in the circular to new building methods. Perhaps the most important of these is to the power which is conferred on the Board if a local authority refuses without reasonable cause to adopt a new material or method of construction which would reduce the cost of houses without unduly affecting their durability, suitability or appearance, to reduce the amount of the subsidy.

As in the 1923 Act the payment of subsidy to private enterprise is made by the local authorities, but as experience has shown that some local authorities have not adopted proposals for the assistance of private builders, the new Act makes

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Plasterers' Masons' Labourers.
Aberdeen	1/8	1/8½	1/8	1/8	1/8	1/8	1/6	1/0½

provision in such cases whereby subsidy may be paid direct to the builder by the Scottish Board of Health.

The circular is on sale at H.M. Stationery Office, 120, George-street, Edinburgh, price 3d.

DOMESTIC WELFARE EXHIBITION

THE Domestic Welfare Exhibition promoted by the Glasgow Corporation opens in the Kelvin Hall on October 13. The leading features of the Housing and Health Exhibitions will be maintained, and many new attractions added. The Exhibition will run for three weeks. The classification of exhibits includes house furnishing, lighting, heating, and labour saving appliances and house decoration. The latter will comprise cements, plain or coloured, cement colouring and flooring materials of all kinds, including wood, parquetry, tiles and mosaic. Also wall linings, ornamental plaster, wall tiles, marble, glass-patterned, stained or coloured, paints, oils, varnishes, stains, distempers, wall-papers and ceiling coverings of all kinds, and decorative mouldings and cornices.

Arrangements have been made for the erection of a five-apartment cottage of steel construction within the Exhibition. The building will be rigid in construction, and well appointed in every way. There will be a class open to architects' apprentices and others not professional architects for a sketch design for a house, bungalow or villa, in any style. The awards will be made by a board of judges to be appointed by the Glasgow Corporation, who are promoting the exhibition. Schedules and forms of entry can be obtained on application to Mr. Cecil Sommerville, general manager, Kelvin Hall, Glasgow. Entries close on October 9.

HOURS OF LABOUR IN SCOTLAND

THE Scottish Regional Joint Wages Committee met recently in Glasgow and heard a report of a sub-committee who had had remitted to them the question of the working hours. The following is the decision arrived at:—

"That, in view of a national settlement having been reached in connection with wages, &c., on August 22, 1924, the agreement for the working hours week for Scotland be concluded in the following terms, in accordance with the provisions for working hours as contained in the constitution of the National Wages and Conditions Council:—

"'(1) That where the 44 hours week (8 hours per day for the first five days and four for Saturday) was in operation on May 22, 1924, the same shall be maintained, with the proviso that on jobs where no artificial light is reasonably possible, the hours may be reduced by half an hour during the first five days of each week during January and December, thus making 41½ hours per week, with half an hour for meals.

"'(2) That where other than 44 hours per week was in operation on May 22, 1924, the normal working week shall not exceed 46½ hours, and the same shall be maintained until altered by mutual agreement. In this case the operatives will be entitled to claim two meal hours. (Note.—This clause will not apply where the extended number of hours were being worked in violation of any understanding which had existed in the locality.)

"'(3) The provision for the half-hour for meals in Clause 1 to be subject to ratification by the National Wages and Conditions Council.'"

Clyde Bridge.

The Glasgow Statute Labour Committee has agreed to the plans of the City Engineer for the proposed bridge across the Clyde at Dixon-street.

Lord Lister Memorial.

A memorial to Lord Lister was recently unveiled in Kelvingrove Park by Sir Hector Cameron. The statue, which is the work of Mr. G. H. Paulin, A.R.S.A., is of bronze, mounted on a granite base.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.

Housing Costs.

Mr. Wheatley (Minister of Health), speaking recently at Glasgow, dealt with the difficulty of ascertaining bed-rock prices for constructing houses, and appealed to municipalities to make a public test. For this purpose he suggested Glasgow Corporation should undertake a small housing scheme, sufficiently large to enable them to get bed-rock prices, make the best arrangements for organising their material, and collect through public appeal, if necessary, a good class of worker, asking them to do their best to keep a careful record of their costs. Let them see at the end of such a scheme at what rate and at what price working-class houses could be erected.

He invited public-spirited contractors to give a public demonstration of what it was possible to do to get their costs right down on a similar scale, and also said he would not mind if municipality competed against municipality in house building.

Damp Walls.

We have received from Messrs. Jenson & Nicholson, Ltd., a pamphlet, entitled "A Manual on the Treatment of Damp Walls." It is issued to assist those engaged in the prevention and cure of damp, and to enable them to select the material for the particular work in hand. The illustrations show, in a concise way, the conditions which may arise from dampness and other causes, and demonstrates the improvements that can be effected by the use of their various preparations. They state that Nepthelene has been specially produced to overcome the alkalinity of cements and plasters. A new wall (whether finished in Portland cement or patent plaster), over which Nepthelene has been applied can, it is claimed, be treated with decorative material with the assurance that the job will be as satisfactory and permanent as if the wall had been an old one. When applied prior to wallpapering, Nepthelene, it is further stated, considerably lengthens the life of the paper and prevents spotting and discolouration, and its action is also to stop efflorescence when paint or distemper is applied. Copies of this useful booklet can be had on application to Messrs. Jenson & Nicholson, Ltd., Goswell Works, Stratford, London, E. 15.

BUILDING OPERATIVES' CONFERENCE

THE National Federation of Building Trade Operatives opened their annual conference recently at Blackpool.

In the course of his presidential address Mr. T. Barron said the difficulties of the hours question would remain with them so long as there was not an attempt by the employers to realise the stern determination of their members not to be pushed back into the bad old days and ways of the past. While they accepted the responsibility of honouring agreements, either on hours or any other matter, they warned the employers that they could not take the present position of the working hours as in any way a permanent solution of the question. They believed that the employers' demand for longer hours was mere prejudice, without any economic warrant behind it; they were confident that in the end good sense would prevail, and that the employers would realise that in an industry calling for hard physical strain and for a great amount of travelling time to get to work, eight hours, with one meal hour, was both an economic and productive day.

Speaking of the men's claim for the guaranteed week, Mr. Barron said they were not asking for something for nothing, and they were aware of the fact that it was only by placing a penalty on the employers that they could hope that any thought would be given to the proper management of work and thus ensure that loss of time would be reduced to a minimum. Another injustice, that of requiring men to provide plant in the nature of expensive tools for the use and profit of employers without any recognition was so obvious that it required no elaboration. They had agreed with the employers to go into these matters, and there could be no permanent peace in the industry until their reasonable and just claims were met.

With regard to the Government housing scheme and the co-operation which had been promised by the employers and the operatives, Mr. Barron said he considered the advantages of the scheme were obvious. Their members would have a measure of security never hitherto enjoyed. Through this scheme, they believed they could gain what the workers had long been striving for, a measure of control in the industry in which they were engaged. It might only in this case be a small measure, but the seed was there, and with careful tending could be brought to full fructification in the future. They had entered into this scheme jointly with their employers, and were prepared to work with them, but they had never sold their freedom of action to deal with this question on their own lines. There had been rumours that the employers were not too willing to work under the scheme. In any case, the operatives were prepared to carry on, and assured the Government that they would carry on with or without the employers' intervention.

Building Trade Apprentices.

The Board of Education has recently issued a circular to local authorities with reference to the agreement concluded between the Minister of Health and the employers and trade unions concerned. This agreement will necessitate the augmentation of bricklayers, plasterers and tilers, and the circular states, in these circumstances the Minister of Health and the Board of Education are anxious to obtain information as to the facilities which can be utilised or provided by local education authorities for giving intensive training to apprentices—*i.e.*, youths normally between 18 and 22 years of age—in building trade subjects.

The proposed course will probably last three or six months, preparatory to entering the industry, but if the authority concerned are of opinion that some alternative course would be better adapted to the circumstances of their area the Minister and the Board will be prepared to consider their proposals.

PRICES CURRENT OF MATERIALS

[Owing to the exceptional circumstances which prevail at the present time, prices of materials should be confirmed by inquiry.

TRURO.—Plans have been passed for a Town Hall, at an estimated cost of £9,000.

WEST DEAN.—The R.D.C. has been considering the question of the water supply. The scheme is a large one embracing about twenty parishes. The Council have obtained grants from the Unemployment Grants Committee and Office of Works. Messrs. W. H. Radford & Son, engineers of Nottingham, are to send the detailed plans to the M.H. The estimate is £45,000.

WESTHAMPNETT.—R.D.C. has received sanction to make grants in respect of 50 houses.

WEYMOUTH.—Plans passed by T.C.: S. J. Board & Son, for Mrs. Penney, detached villa, Burcleaves; Messrs. Jenkins, Hitt and Grant, Ltd., for Mr. H. F. C. Jenkins, bungalow, Bent-path-avenue; Messrs. S. Jackson & Son, for Mr. G. Plumpton Smith, villa, Alexandra-road; Mr. K. Openshaw, pair of semi-detached bungalows, Southlands-road; Mr. F. Greenaway, for Mr. F. Cater, villa, Alexandra-road; Messrs. Jesty & Baker, house, Clearmount-road.

WILLESDEN.—A scheme is to be prepared for the widening of Kilburn Bridge. A convenience is to be erected at Craven Park Junction. Tenders are to be obtained for the provision of mess room accommodation for hospital motor ambulance drivers.—Plans passed by the U.D.C.:—House, 7, Dollis Hill-lane, by Mr. F. Osler, for Dr. T. P. Nunn; 14 semi-detached houses, Oxgate-gardens and Edgware-road, for Mr. F. W. Brealy; six houses, Hanover-road, Kensal Rise, by Mr. H. Shaw, for Mr. F. Hilborn; new factory premises, Neasden-lane, Neasden, by Mr. S. A. S. Yeo, for The Royal Sovereign Pencil Co., Ltd.; twelve houses, Mount Pleasant-road, Kensal Rise, for Mr. C. W. B. Simmonds.

WIMBLEDON.—Plans passed by B.C.:—A. M. L. McKay, house, Copse Hill; Limpus & Son, house, Lauriston-road; W. H. Whitehead & Co., house, corner of Montana and Langham-roads; J. Browne, four houses, Albany-road; W. W. Gibbings, house, Wimbledon Hill; H. Coombs & Sons, two houses, Devas-road; W. R. Dibben, house, Copse Hill; H. Jeffery, Spiritualistic Church, Hartfield-road.

WORCESTER.—The Severn Commissioners have decided to erect another electric power station at Ironbridge.

FIRES.

KILMEADON (CO. WATERFORD).—Extensive flour mills belonging to Mr. J. O'Brien, of Waterford, have been destroyed by fire. The damage is estimated at £30,000.

SALISBURY.—Park Mills, Salisbury, a hemp and jute factory was destroyed by fire recently. The damage is estimated at several thousand pounds.

OLUMN FALLACIES

paper, entitled "Column Fallacies," fore the Institution of Structural Engi-me time back, Mr. E. H. Salmon dealt e following "fallacies":

hat Euler's limiting load merely implies from one type of stable equilibrium er, and does not involve the failure of mn.

hat the defect in Euler's formula is ect of the direct compressive strength.

hat the deflection of an ideal column definite function of the load.

hat the Eulerian length relations have licability in practice.

hat it is possible to prove the Rankine-formula theoretically.

hat the constants in the "eccentricity" the Rankine-Gordon formula are the those in the ordinary Rankine-Gordon

hat a "straight-line formula" is the column formula.

hat eccentricity of loading is the principal f weakness in columns.

hat the eccentricity of loading on the rvature are functions of the radius of

hat the bending stress in the ordinary erfectly direction-fixed at the ends is the middle and ends.

hat if given end conditions, the "free is a fixed proportion of the length of ary column.

hat there is a tension-side in the practical column.

hat the Considere-Engesser theory ues for the crippling load suitable for actical design.

hat a column with flat ends is fixed in at the ends, and that its failure is bout by the ends "swinging round."

hat a "solid" column is stronger than laced column.

hat in built-up columns, the moment of inertia about the two principal axes should be the same.

(17) That bottom plate columns are necessarily unscientific in design.

(18) That the ordinary theory of columns has any applicability in practice.

Dealing with No. 8, he said: There was a tendency in some quarters to regard eccentricity of loading as the prime, if not the only, source of weakness in columns, and the majority of semi-rational formulæ for columns contained terms allowing for either or both unintentional and intentional eccentricity. It was quite true that in a column with position-fixed ends, such as a round-ended specimen in a testing machine, eccentricity of loading had a great weakening effect, but if the ends were fixed in direction also, the eccentricity had no effect whatsoever. In practice, one or both ends of almost every column were attached to some other part of the structure, which attachment more or less fixed it in direction, often very imperfectly, but only in very rare instances was the member free to deflect as an eccentrically loaded specimen. Yet the secant formula in various disguises was quite commonly applied to such members. The attachments referred to usually resulted in external bending moments being applied to the ends of the columns, often exceedingly difficult to determine with accuracy, and too often neglected in design, but the effect of such moments is not the same as an eccentricity of loading, nor was the ordinary eccentricity formula applicable. On the other hand, initial curvature was inevitable in all columns, and alike weakened both position-fixed and direction-fixed columns. Its effects were by no means identical with those produced by eccentricity of loading. It greatly modified the distribution of stress in the ordinary direction-fixed column as compared with the ideal, perfectly straight, direction-fixed column, and it further had the effect of considerably increasing the shearing force as compared with eccentricity of loading. There was some justification, therefore, for the view that initial curvature was the prime cause of weakness in columns. Nevertheless, Howard, of Watertown Arsenal, who, with the possible exception of Tetmajer, must have conducted more experiments on columns than anybody else, regarded reduction in the quality of the material due to effect of past history, particularly cold-straightening and stresses set up during manufacture, local permanent sets, &c. (to which might be added annealing—in fact, any cause which lowered the elastic limit), as the chief cause of weakness in columns. He said that "variations of 25 per cent. and over in the elastic limit, as found in these plates and angles, would overshadow those considerations which find expression in empirical formulæ for strength and take no account of such variations."

In connection with "fallacy" No. 18, he said: the ordinary theory might be said to have originated with the experiments of Musschenbroek in 1729, who found that the strength of his specimens varied inversely as the square of their length. This discovery appeared to conflict with the ordinary beam theory as then understood, and led Euler to his famous investigation, which resulted in the well-known Euler formula. Euler himself was not a little puzzled by his result, and it started a fierce controversy which had never completely died out. The practical men said the theory was nonsense. Their attitude was well expressed by Robison (1822) who characterised Euler's memoirs as a "dry mathematical disquisition" based on assumptions which were "extremely gratuitous," and said that "the most important consequence of the compression is wholly overlooked." He therefore rejected Euler and the speculations "with which he was then amusing himself" as false and useless. The mathematicians confirmed Euler's results, and gave more rigid and stricter analyses in support, but the objections of the practical men still required an answer. One man, it was true, saw through the question—that somewhat unappreciated genius, Thomas Young—who, in 1807, pointed out that the differences under discussion were due to want of agreement between the assumed and actual conditions. Young, in 1807, first gave the correct theory for both eccentricity of loading and initial curvature (given as exercises for students!) and pointed out the now well recognised validity limit of Euler's formula, thus disposing of most of the difficulties. Possibly owing to his confused and obscure style the world in general ignored Thomas Young, and proceeded to make experiments—to prove or disprove the correctness of Euler. If all the well-known series of experiments be examined, from Hodgkinson onward (excepting only some of the American experiments), they would be found to be modelled on the Eulerian theory as a basis. Now, the Eulerian assumptions, although convenient for the mathematicians, were very difficult to realise in the testing machine, and so experimental conditions had gradually established themselves based upon the theoretical assumptions, but having essential points of difference. Hence had arisen differences between the theoretical and experimental findings, and great pains had been taken to reconcile them; but in spite of all the disputations, mathematical and otherwise, which the column theory had evoked, the battle of the formulæ still broke out afresh on occasion, and the merits of this or that expression as an interpretation of experimental results was laboured once more. Meanwhile, the dust of controversy had quite obscured the fact that widely as the theoretical and experimental results differed from each other, they both differed still more from the practical member.

The ordinary practical column was a relatively short, initially curved, member, not homogeneous, and usually built up of a number of separate elements. It was usually more or less rigidly connected to the other members of the frame of which it formed a part. It was therefore fixed both in position and direction at its ends, though the fixing was often very imperfect. Due to these quasi-rigid end connections, the column shares the general distortion of the framework, and in consequence had to carry bending moments transmitted through the end conditions. These bending moments were usually of the same "hand," so that S-shaped bending was the rule. The deflection curves usual in text-books had no validity in practice. The magnitude of these bending moments depended on the relative stiffness of the various members of the frame, and still more on the "give" of the connections. They could only be determined by consideration of the distortion of the frame as a whole, and were very difficult to determine theoretically. Nevertheless, he believed that anyone with the time and opportunity, who, forgetting the column theory as usually presented, would go to actual structures, and determine from them what actually happened to the members, would find himself in a new, very scantily explored region, and out of such determinations a new column theory would arise founded on practical facts, with frame distortion as the underlying basis.

TRADE NEWS

There are many and various methods of casting concrete piles *in situ*, but it does not necessarily follow the piles will answer the two essentials of being sound throughout their length and free from voids. Messrs. The British Steel Piling Co., Ltd., claim that a pile cast by the "Zenith" Vibro Concrete Pile Process is solid from toe to head, fills the hole completely, and keys itself to the soil. The idea, briefly, is to sink a tube to the required depth and to withdraw it 1½ in. at a time. During withdrawal the concrete is fed through the centre of the tube and rammed by the rim of the tube, which has an up and down motion (80 strokes per minute). This forces the concrete into the hole and results in a completely solid pile. Not only does this method guarantee a thoroughly workmanlike job, but it is claimed it can be done at half the price of pre-cast piles.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

L.—No. 4261. OCTOBER 3, 1924.

PEACE IN THE BUILDING INDUSTRY

s reported that at the annual general meeting of the Jational Federation of Building Trade Operatives resolution was passed unanimously to the effect that he entire operative fraternity would resign from the Jational Wages and Conditions Council. If this course e adopted it is for the time being the end apparently nal settlements of disputes in the building trade, and ition may be a serious one. For the National Wages nditions Council has been for some years now the only npowered to settle disputes, in so far as it had been that no strike or lock-out should be declared until the n dispute had been referred to the joint national body ement. With this body removed, the way would be clear stant local disputes and consequent dislocation of the y.

irst sight it would seem to be a retrogressive course. tory of the organisation of the building trades, both e employers and the operatives, has shown a tendency om local government and towards national legislation whole. Consequently, to revert to sectional demarca- ust seem a retrogressive step, though it must be re- ed that for the last two years there has appeared to be a dissatisfaction with the joint council, judging from t that it has been necessary to submit the Council's to arbitration on more than one occasion.

eview very briefly the history of the movement may seful at such a crisis. In 1916, in common with a feeling throughout the industry, both sides became impressed desire to render their full share towards the creation of nd better industrial order. Towards the end of 1916 ls to this end were circulated and submitted to the l Federation of Building Trades Employers by the g Trades Council. Out of these arose the Building Parliament, which, though it preceded, soon became ted to, the Whitley Councils, which from 1917 onwards up in every industry with a view to obtaining industrial At this point a quotation from the introduction to the for the Builders' Parliament may have an interest ing on the present, and the resolution reported above drawing from the National Wages and Conditions : "Both employers and employed," says this intro- "have been the unwilling victims of a system of ism that has organised industry on the lines of a tug- and permeated the whole national life with sectional f thought and outlook."

at was the condition in 1916, it would not seem a pro- step to revert to sectional settlement in 1924. When et up in May of 1918, the Parliament became known Industrial Council for the Building Industry, and the included "Regularisation of Wages—Prevention of oyment—Employment of Partially Disabled Soldiers— l Training and Research—Continuous and Progressive ement—Publicity. Though the Parliament continued four years, and effected a certain amount of good, to an end, as all such bodies must which exist only as a mutual trust continues, when that trust and con- eased. The death blow was administered by the Foster and arising out of that the National Building Guild.

Out of the ashes of the Parliament, and even before its final decease, arose another joint body known as the National Wages and Conditions Council, functioning, as its name implies, in the settlement of disputes concerning wages and conditions of labour. Education and advancement were for the time being in abeyance. For a time this functioned well, all adjustments of wages being automatically arrived at on an agreed scale known as the sliding scale, based on the cost of living figures at the time of the periodic adjustments. But here again lack of confidence brought disagreement even with the interpretation of the meaning of terms of the document, which both sides had previously agreed as being the constitution of the joint council. As it must be presumed that both sides knew and understood what they were agreeing to at the time of the establishment of the Council—it was certainly discussed in sufficient detail—the failure to function can be only due to a loss of mutual confidence. So that in 1924 the industry is practically where it was in 1916. Circumstances actuate in wave motions, and the waves have rolled back. But as surely as they are now in retirement so surely will they progress forward again.

May this not be, therefore, yet another opportunity for a further effort towards the permanent betterment of the conditions of the industry? And in the making of that effort will it not be wise to give the fullest reflection possible to the cause of disruption in all past effort? It has been suggested in our columns on various occasions that the composition of the joint bodies may not have been sufficiently wide in its embrace, and that there are more than two parties that go to make up the building industry. There are three parts, if not four. And is it not reasonable to suggest that all parties concerned should be represented upon a joint board that is empowered to settle the conditions of that industry in which these parties are concerned? Can any lasting settlement ever be effected by two parties who conceive their interests to be opposed? Is not the mediation of some third party essential to such settlement? The final resort to arbitration, as in the case of the Fraser award and again more recently Lord Buckmaster's intervention, after all the avenues afforded by the National Wages and Conditions Council had been explored and failed in providing a solution, would seem to prov beyond doubt that a third party as mediator is essential.

If this is so, if it is a fact that no permanent ettlement can be reached between two parties to an industry and resort has to be made to a third party, to whom can such appeal be made more suitably than to a third party to the industry where such party exists? In the building trade this third party does exist, *i.e.*, the building owners, represented by their architects. To whom could it be more suitable to make final appeal in any matter in dispute between the employers and the operatives than to the architect? Who more fitted by training, knowledge, education, and experience? We should like to see representatives of the profession come forward with a properly considered scheme for the constitution of a joint board composed of all parties, to take the place of those composed only of two and which have failed: and let these representatives proceed with the requisite energy to see that their efforts meet with recognition and beneficial result.

NOTES.

Standardisation in Housing. In order to meet the urgent need of houses we see it argued that standardisation is necessary, with its accompaniment of monotony, if nothing else unpleasant. If the demand for houses can be met in no other way than that of mass production—which may be questioned—it is at any rate of the first importance that the original design shall be one which is in itself becoming. It is, unfortunately, the case that we have had to associate mass production with great poverty of taste, and it is evidently desirable that very much more care should be taken to secure some decency of form in what is to be reproduced so many times. In the case of pottery, the mass production of teapots and jugs, for instance, it is no great evil if the original design from which so many thousands are to be produced is in good taste and fitted to its use, and it is towards this that the manufacturer is moving, replacing foolish and exaggerated shape and vulgar ornament with better design. It appears to us that any scheme for mass production of houses should not be broadcast, but limited to districts taking note of local characteristics. Thus a standardised building suited to Glasgow would be unsuitable, let us say, in York, where local characteristics are different. When we come to consider how, in the first instance, to secure good design in all the parts of small houses or cottages, it is more difficult, for without sound architectural guidance—unless the matter be first entrusted to architects to scheme out something appropriate—we are likely to suffer from an accession of ugliness.

The Burden of Housing. Mr. J. E. Drower's series of articles in *The Times* under this heading show a refreshingly broad outlook and should be of the greatest value in familiarising the public with our problems. We find among the fundamental requirements in a house that "health, comfort and decency must be considered, and the eye must not be displeased." This sound advice shows how far we have advanced during the last few years, for a very short time ago one would have been branded as "unpractical" if one had suggested that there was the slightest objection to ugliness in a house. We are filled with envy when we hear that we must beware of flat cement roofs because "the rooms under are insufferably hot in summer." We wish we had been under one of these roofs last August!

Ivy. There exist two principal ways of destroying buildings, both equally efficient, but one quicker than the other—(*a*) dynamite, (*b*) ivy. The destruction wrought every year by the latter would be astounding could it be put into figures. Once ivy has attained a real grip on a building it will send its roots into every crevice of the wall, sucking the mortar into dry dust; its tendrils will wedge the stones apart, and its branches act as sails to catch the wind. The result is inevitable. or later during a storm the collapses and everyone attributes the action of time instead of attac blame to the ivy. But even if not these deadly attributes there nothing beyond a vague sentim to urge in favour of its existence old ruins that possess the slighte tectural value. Ivy has its plac suitable enough when restricted walls of no value or interest or tree stumps. There is no doubt, what we do about ivy and its need of a great deal more circum as to its control.

A £32 Cottage. There is a good interest in the stat a correspondent *Times* who describes how he b four-roomed thatched cottage, bu 40 years ago, and sold by two l "who, I imagine, built it" for £ price included the freehold la garden. A few years later it hands at £45, so there was no app worked by time in the characte building. The point is, as th spondent adds, "that it is now by a friend of mine, and thoug not 'modern conveniences' it 'to be incomparably warmer a comfortable to live in than the lately built in the village b authority at 30 times the cost.'" wit seems here to have been ca more than all the machinery of tion, and it suggests the consider

give more play for this native ; this initiative of the handy o use his brains and apply his dent methods to the problem of . We are reminded of additions me years ago to a country house, g much reconstruction and altera- cluding a 40 ft. chimney stack, alterations and additions were lished by village labour, a handy ho could thatch or lay bricks, a fence as the need occurred ; the er, a labourer also from the village, asterer called in from the adjacent Under lay guidance the work ecuted in a very unconventional ut many were the cars which up in the by-road that passed se to see this effort of village anship, which, however, was mistaken for ancient work in spite riginal intention of the workers.

---

eed en. SOMEHOW or other we have to find means of liberating more of this personal initia- he correspondent goes on to "Can nothing be done to en- individual effort ? An English- still use his hands if he is given e." All this is well worth ponder- er. Our towns and country abound in men of robust practical learned in a hard school and fit with such work, but they are not Organisation fails us if it fails to men, or uses them so little, or s them that they have no power tive granted them. We feel in so stances that the housing scheme he machine rather than the man. had enough experience of the so- ude and uneducated to realise re often lies in him a power to do acking in the more theoretically

National Monuments. THE fact that some three hundred monuments are now noted as under the protection of the Office of Works is indication enough of the value to be attached to the persistent efforts in recent years for the preservation of places and things which by reason of beauty, tradition, or association claim a vital interest from the nation. Besides subjects of some outstanding importance, however, there are many which can only be preserved by the good will and intelligence of private owners, and the value of many modest but valuable old buildings is often ignored or overlooked unless the vigilance of a Society or a professional man is pertinently exercised. We should all be interested for the common good in helping to identify and preserve those relics of the past which still add to the charm and interest of our modern life.

Industrial Truce. IT is, perhaps, too readily assumed that to delay an evil may be to put it off altogether. But if a truce in industrial disputes could be arranged on such terms as would allow time and opportunity for trade to revive, should we even then be in a better position to estimate fairly and rightly the proper functions and values of capital and labour and of their relations to each other ? We doubt it unless we all give up the aim of making political capital our real objective. Then, of course, if there be any value in having a truce is it not in the hope that it may be made perpetual ?

The 24th Division War Memorial, Battersea.
MR. ERIC H. KENNINGTON, Sculptor. (*See p.* 506.)

GENERAL NEWS

Professional Announcement.

Mr. G. Alan Fortescue, A.R.I.B.A., has removed to 46, Dover-street, W. Telephone: Gerrard 3415.

The Berks, Bucks and Oxon. Architectural Association.

The "Year Book" of this Association has recently been issued. The Council state the year 1923 was one of steady progress in numbers and in activities; the membership, exclusive of honorary members, now amounts to 141.

Architects' Estates.

Mr. Arthur Eaton, of The Summit, Burton-road, Derby, architect and surveyor (net personalty £4,142), £6,594.

Mr. George H. Barrowcliff, of Loughborough, architect and surveyor (net personalty, £2,024), £10,482.

New Methods of Building.

The Committee which has been set up under the chairmanship of Sir Ernest Moir to inquire into new methods of house construction met recently. With a view to expediting their investigation the Committee would be glad to receive as soon as possible any further proposals for new systems of house building or for new materials. All communications on the subject should be addressed to the Secretary, Mr. T. H. Sheepshanks, Ministry of Health, Whitehall, S.W.1.

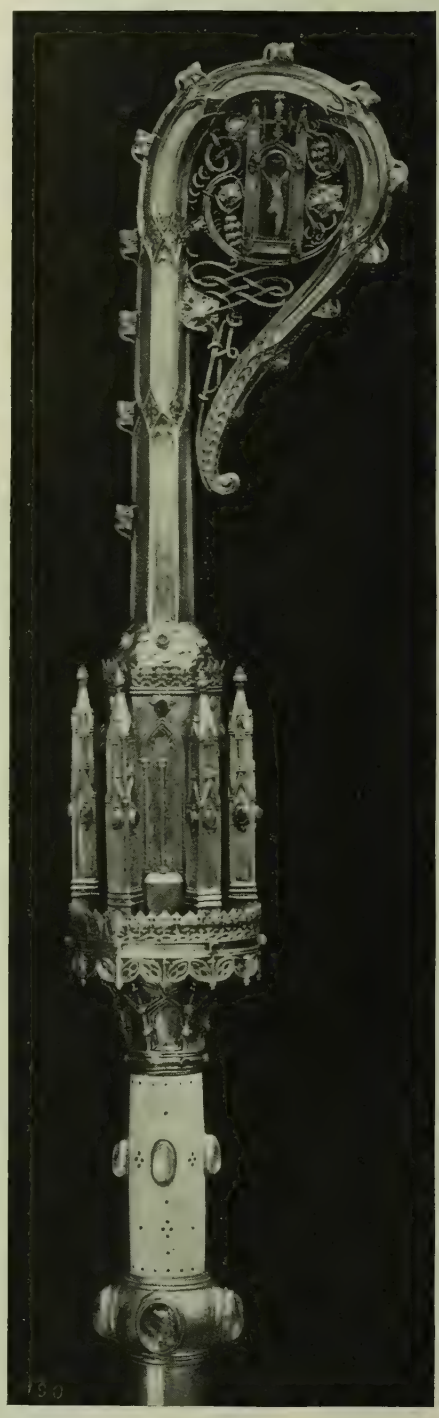
London University Lectures.

Dr. Percy Dearmer will lecture on the ten Tuesdays of the autumn term on "A Summary of Ancient Art," at King's College, Strand, commencing at 5.30 p.m. on October 7. The lectures, which will be illustrated by lantern slides, will deal, amongst other things, with the architecture of ancient Greece and Rome. Admission for non-members of the University is by ticket (price 1s.) obtainable at the door. A syllabus of the lectures can be obtained, post free, from the Lecture Secretary, King's College, Strand.

Liverpool.

The Medical Officer of Health has just issued his report for 1923, with observations up to June 30, 1924, in which he states that the position of the housing question is still an unhappy one. In the ten years preceding 1914 the number of houses built was 17,743, while during the ten years succeeding that period only 7,576 have been erected, although during these latter years the population has increased by 59,846, so that Liverpool at the present time is worse off as regards housing accommodation by rather more than 10,000 houses.

Proposed Town Hall, Greenwich.



The Greenwich Borough Council recently gave consideration to a proposal to purchase the freehold of Charlton House, the residence of Sir Spencer Maryon-Wilson, Bart., and other buildings, together with the land, for £60,000. The special committee are of the opinion that, if the property is purchased, the question of the provision of additional houses should be uppermost. They also consider that the mansion is suitable for a town hall, and would be large enough to house every department of the Council. The cost of a new town hall, it is estimated, would not be less than £100,000.

Obituary.

Mr. J. J. McDonnell, F.R.I.A.I., died recently at Belfast. Born in 1857, he was a pupil of the late Mr. Timothy Heavy, F.R.I.A.I. The late Mr. McDonnell designed many Roman Catholic churches, convents, schools, &c., throughout the North of Ireland, the church and monastery of the Redemptorists at Clonard, Belfast, and the new Church of Our Lady of Lourdes at Toombridge, co. Antrim. St. Paul's and St. Brigid's Churches, Belfast, and the churches at Kilcoo and Teconnaught, co. Down were built to his designs. A member of the Royal Institute of Architects since 1884 and in later years a Fellow, he was a former President and member of the Council of the Ulster Society of Architects.

Exhibition Notes.

A rather exceptional little show of water colours is on view at the Grosvenor Galleries, in Bond-street. The delicate charm of drawings by Hester Frood will be much appreciated; and there are a number of drawings by Muirhead Bone, some of exceptional quality. His expression of the Doric columns in the Corinth drawing and a forcible water colour of Constantinople, with a sea view of Stromboli are things which arrest one amongst much that is vivid and attractive. James McBey has several telling sketches; and Sir D. Y. Cameron's small drawings lend distinction to the collection.

Silver Crozier for Maryland Cathedral U.S.A.

Designed by MR. EDWARD SPENCER.

(*See p.* 508).

COMPETITION NI

Freemasons' Hall, Nottingham

Messrs. John Howitt & Son have bee ful in a competition for the erection of in Goldsmith-street, Nottingham.

Bradford Masonic Hall.

The full result of this competiti follows: (1) £200, Messrs. Ross & 78, Manningham-lane, Bradford; Messrs. Eric Morley and Wm. Il Market-street and Sunbridge-road, (3) £100, Messrs. Longbottom & Teb mercial-street, Halifax.

Christian Science Church, Southp

Designs are invited for a new ch Sunday school at the First Church Scientist, Southport. Premiums of and £30 are offered respectively. The are Messrs. J. E. Sanders & Son, A. 219A, Lord-street, Southport, to whom tion should be made, accompanied by a of 10s., returnable only to those wh designs.

[Barrow Hill Memorial Club.

Applications are invited for pl specifications for the erection of a way of extension of the existing Ba Memorial Club, near Chesterfield. App cost, £4,000. Particulars can be obta the Secretary of the Club.

Other Competitions.

Other competitions still open inc following (the dates given are, first the s date, and second the issue of *The B* which full particulars were given) :— Hall (May 1). Manchester Art Gallery Aug. 22). Concrete Cottages (Oct. 31;

THE 24TH DIVISION MEMORIAL, BATTER

A London sculptor, Mr. Eric H. Ken has designed an original memorial to t in Battersea Park, London, of a famous Division. Three men of the Divisio closely together, with hands clasped full accoutrement. At their feet is snake which they have together Although the men are uniformed, this obtrude nor hide their essential h They stand straightly and firmly o inscribed boldly with name and date. its turn is supported on a circular ornament being the crests, badges and of the regiments, redesigned by the into a frieze. THE CHURCH CONGRESS EXHIBITION

No centre in England perhaps could have been chosen with such wonderful associations in regard to the story of the Church as Oxford. The whole atmosphere of the fine historic city is just the right one. Only once before has the Church Congress been held there, and that was so long ago as 1862, the year following its institution.

The Exhibition, which always takes place side by side with the Church Congress, is this year held in a specially erected building, it being impossible to find in Oxford a hall large enough for its display. The governing body of Christ Church kindly loaned a site in the Merton Field, Rose-lane. It is very near the Botanical Gardens and easily approached from the High-street. Here the two distinct sections of the Exhibition are arranged, the General and the Loan.

The General Exhibition.

This consists not only of a large number of exhibits of many of the larger and more important Church societies and religious and philanthropic organisations, but also consists of the stalls of a great number of well-known church furnishers, church publishers, noted artists and guilds of craftsmen. It is a very great opportunity for the display of really fine work. The publishers and their printers and binders generally do excellently. The help societies also make splendid displays of their activities; but somehow, with just a few exceptions, the work shown by the firms and their craftsmen in metal and wood, stone and marble, fail to impress, and the level is certainly not so good as it should be.

Generally, the craftsmanship is better than the design—this, over and over again, fails badly; at times we are back in the 60's and 70's of the last century. The lettering of many of the memorials shown is extremely poor. The fine work of Edward Johnston and Eric Gill has in no way been studied. Now students in all our craft schools are taught how to letter well. Why do not these firms obtain their services?

The silversmith's craftsmanship is certainly of a very high level, as illustrated in two or three of the artists' exhibits; perhaps nowhere could such fine work be seen. The very charming altar cross, candlestick and vases in silver, made for the Chapel of Wickham Abbey School, are quite perfect in their way. These have been designed by Mr. Edward Spencer, and they were made by the craftsmen of the Artificers' Guild, of Conduit-street, W. Their stall is filled with some of the most beautiful work of the modern silversmith. A crozier, designed also by Mr. Spencer and made by the Guild, has recently been sent to the States. It was made for the Cathedral of Maryland, and is excellent in its design, outline and execution. Most beautiful chalices, alms dishes, and a wonderful variety of other church and secular plate is extremely well shown.

Another well-known gold and silversmith, Mr. Omar Ramsden, is very well represented by many choice pieces of fine design and excellent craftsmanship. He pleads "that such vessels and ornaments as we may add to our cathedrals and churches should be worthy to be handed down to future generations as representative of our epoch." He has devoted himself to the study of ecclesiastical and ceremonial plate for many years and has executed many fine things. A large silver cross is shown by him, made for St. Michael's, Chester-square, W., a replica of the one that was recently stolen; and there are exhibited a great number of other excellent pieces, particularly fine altar crosses and candlesticks, as well as chalices and hanging lamps.

Messrs. Barkentin & Krall exhibit a great number of more orthodox pieces; nearly all are greatly influenced by old work. A fine rock crystal and silver cross is shown with its two charming candlesticks. Last year this firm made the remarkable silver reredos for the Lady Chapel of Saint Mark's Church, Philadelphia, U.S.A. Its width is nearly 7 ft., and its height 11 ft. Messrs. Keith & Co. and Messrs. J. Wippell & Co. also exhibit silversmiths' work. On the whole, with the exceptions mentioned, most of the other metal work is not very good.

The Bromsgrove Guild show details of two interesting windows, recently placed in the Cathedral Church of Hereford. Each consists of four lights, and they were designed by Mr. A. J. Davies. They are in memory of Bishop Stanbury, and certainly are extremely interesting specimens of recent glass work. There is a great deal of other glass work shown, but little of it calls for any note.

The Royal School of Needlework show some extremely good examples of their craft. A hanging, for the altar of the Lady Chapel of Southwark Cathedral, which has been kindly lent by the Dean and Chapter, could hardly have been more beautifully designed or worked. The designer was Mr. J. N. Comper. The subject is the Crucifixion.

Over it is placed a very fine frontlet for Hatfield Parish Church; in its original position it comes over a rose brocade frontal. The lettering is admirable. The designer was Mr. W. H. R. Blacking. The Great B
Westminster Abbey is also very g

the above call for special comment.

The Loan Collection.

The section of the Exhibition whi
many of its adherents look perh
forward to is the general display o
church plate, service books, ma
vestments and other needlework
annually gathered from the district
the meeting is held. Each district ha
peculiar and distinctive characteristic
and workmanship, and the Oxford di
its own traditions quickly recognisable
of its plate. It is this that makes th
display so fascinating. And again, th
other great advantage to the lover
beautiful works of art of the past;
of these fine pieces would never be se
by a very few had not these exhibi
instituted. This year these treasure
played in an annex of the great
hall and, as is usual, there are ve
beautiful pieces shown illustrating
the silversmith's craft. There ar
strikingly beautiful pieces made pr
1500, but the greater number are of
turies after.

The vicar and churchwarden of
Oxford, lend one of the earliest piece
shown (34). It is supposed to have b

It is recorded as a chalice. "The
nble. Countess of Huntingdon gave
ust 28, 1677." It is dated 1676,
ving Gothic lines, it looks of earlier
hip.

As is natural, the plate of the time of Queen Elizabeth is extremely well represented. This was the great period for replacing the destroyed treasure of the churches. All the early pieces of this period, although so different in design and workmanship, are beautiful in their own way. The great ceremonial having changed, they also have changed—they have become communion cups instead of the splendid chalices.

From the church of Fifield-cum-Idbury, Oxford (66), is loaned a beautiful one with its cover, both dated 1576; and another is loaned by the vicar and churchwardens of Leigh Delamere, Wilts, of similar fine proportions and workmanship. It is dated 1577.

The plate sent from Easton Maudit Church, Northampton, is of silver-gilt, and consists of the chalice and paten and the flagon. The height of the chalice is 11¾ in., and the date is 1630. The flagon is dated 1672, and its height is 12½ in. These are very fine examples of the period.

A glass cup in a leather case also is loaned by the same church. It belonged to Bishop Morton. It is perhaps of rock crystal and of Italian workmanship. It is only about 5 in. high and elaborately engraved and gilded. It is lent by the rector and churchwardens.

The very fine silver-gilt grace cup of the City Church, Oxford (400), is now used as a chalice. It was made in 1606 and weighs nearly 20 oz., standing 16 in. high. It is a splendid piece of plate, and is the one fine steeple cup in the exhibition.

The great communion cups and flagons which followed from, say, 1680 to 1800, are very well illustrated. Two silver-gilt flagons dated 1718 are loaned from the church of Aldermaston, Reading, and one fine one is sent from the Abbey Church at Tewkesbury: it weighs over 54 oz., and was given in 1688. Another is loaned from Kirtlington Church, Oxford, and was made in 1723. One from the Church of Steeple Ashton, Trowbridge (174), made in 1736, weighs 84 oz., and is more than 14 in. in height.

At this period very little difference seems to have been shown between the plate used for the services of the church and the plate for domestic, college, or city companies' use; the secular type predominated. The fine subtleties of the early pieces become lost entirely and are not attempted again until the craftsmen of the Mid-Victorian period, under the influence of the Gothic revival and its leaders—Pugin, Barry, Scott, Street, Butterfield, and many others—again revert to old types out of which has sprung a tradition which has inspired such fine modern work of to-day. The early men were followed by Bodley, Bentley, the younger Scott, Sedding and others, and they did much to induce the individual craftsmen to produce charming things that have been gradually placed in our cathedrals and churches; and men like Henry Wilson, Bainbridge Reynold, Paul Cooper, Edward Spencer, and Omar Ramsden have all helped to continue the fine tradition of English metal craftsmanship.

In addition to the plate are gathered and exhibited excellent examples of old Italian and Spanish needlework as well as English. Some very recent work is also shown. The pall made in 1918, designed by Mr. C. G. Hare and executed by Messrs. Watts & Co., is a fine example. It belongs to the English Church Union. The other fine pall shown is lent by the Dean and Chapter of Westminster Abbey (49). It was designed by Mr. W. D. Carõe, F.S.A., and executed by Miss M. Hollier. It was given by the Actors' Church Union. Other fine pieces of needlework—two stoles—have been designed by Mr. J. N.

Altar Cross and Candlesticks, Wickham Abbey School Chapel.

Ciborium in Hand-wrought, Chiselled and Repousse Silver Gilt.

Designed by MR. OMAR RAMSDEN.

Comper, and are loaned by Worcester College. Oxford.

The setting provided for this exhibition is hardly worthy the great treasures gathered together. The exhibits are crowded; at least four cases more should have been provided. It is perhaps unwise not to confine the exhibits from the district and neighbourhood; a general collection is not wanted; it is the work of the locality that is so fascinating. Types of local craftsmanship should be sought for, and then it would be possible to compare them with other districts and careful study would be possible. The offer of a piece from a distance it would be well to resist. An old hall, such as a college hall, is the real setting for these precious things, and it is a little unfortunate that one could not be obtained.

The Exhibition of the Church Crafts League.
